Stability.

⇒ For an LTI System, the LTI System is said to be stable if the it satisfies the following conditions.

- ① If the input is bounded, the output must be bounded.
- ② If the input signal to the system is zero, the output must be zero irrespective of all the initial conditions.

⇒ This Stabilities are classified into the two way based on operating conditions.

① Conditional Stable System:

⇒ Here, the system is stable for certain range of system components.

② Absolutely Stable System.

⇒ Here, the system is stable for all the values of system components.

(3) Marginal (or) Critical (or) Unstable Stable

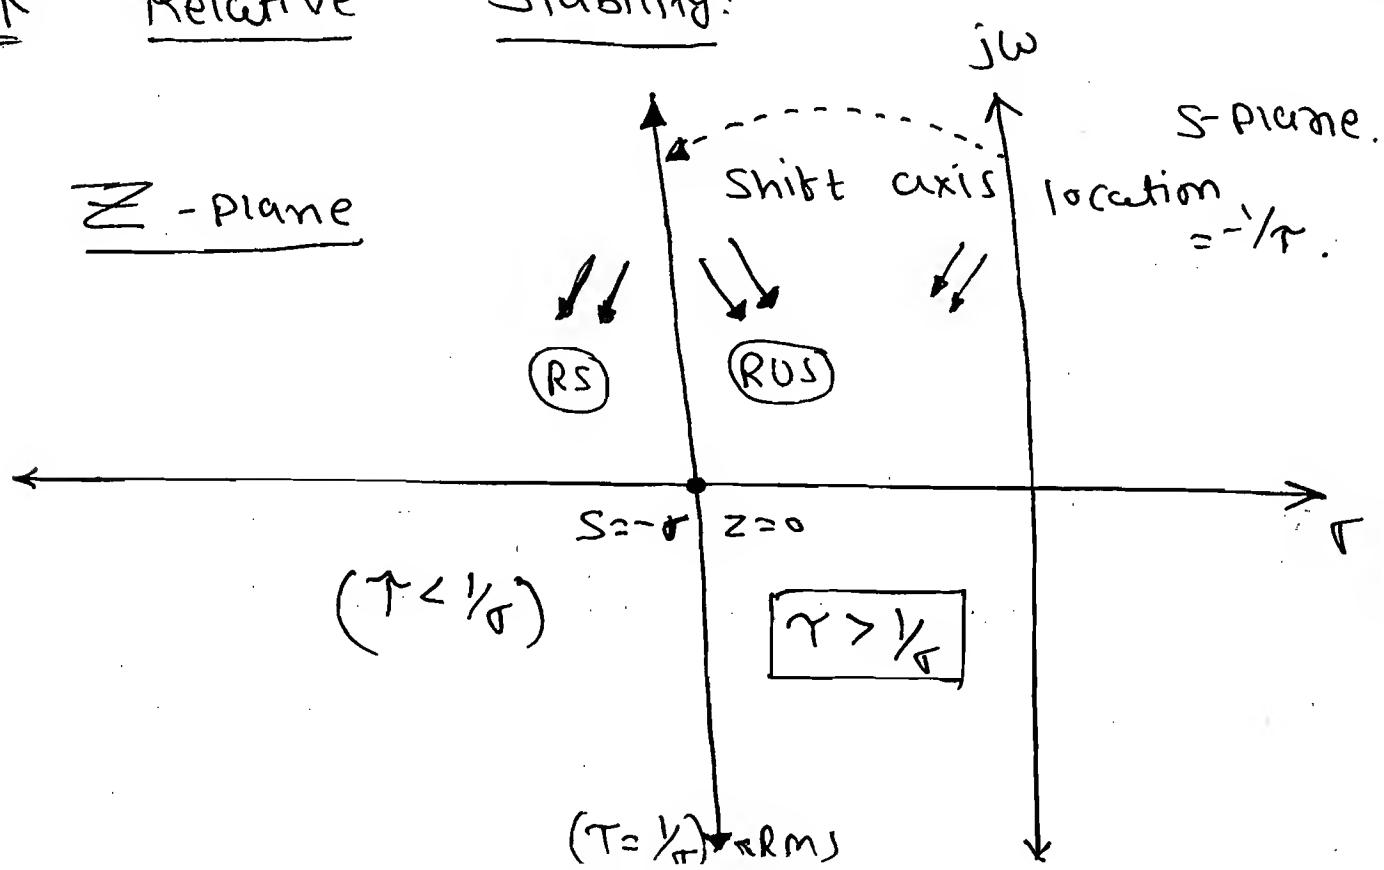

System:

→ A linear time invariant system is said to be marginal stable if for the bounded input, the output maintains the constant amplitude and freq. of oscillation.

→ The non-repeated pole on imaginary axis gives the constant amplitude and freq. of oscillation & the system is marginally stable.

* Relative Stability:

Z - Plane

⇒ The relative Stability Concept is applicable only for Stable System.

⇒ By using relatively Stable Concept we can find system time constant, settling time and time required to reach steady state.

* Techniques used for calculate stability are:

- 1) Routh - Hurwitz Criterion.
- 2) Root - Locus.
- 3) Bode plot.
- 4) Nyquist Plot.
- 5) Nicholas Chart.

* Routh - Hurwitz Criterion:
(RH Criterion):

* Purpose:

- ① To find the Closed Loop System Stability.
- ② To find the no. of closed Loop Poles lies in the right, left, an

imaginary axis of the s-plane.

⇒ ③ The main purpose of the RH-criteria is to find the no. of poles in right of s-plane only.

⇒ ④ To find the range of K-value for CL system Stability.

⑤ To find the K value to become the system marginal stable. (or) Undamped system.

⑥ To find the natural freq. of oscillation (or) Undamped oscillation.

⑦ To find the relative stability.

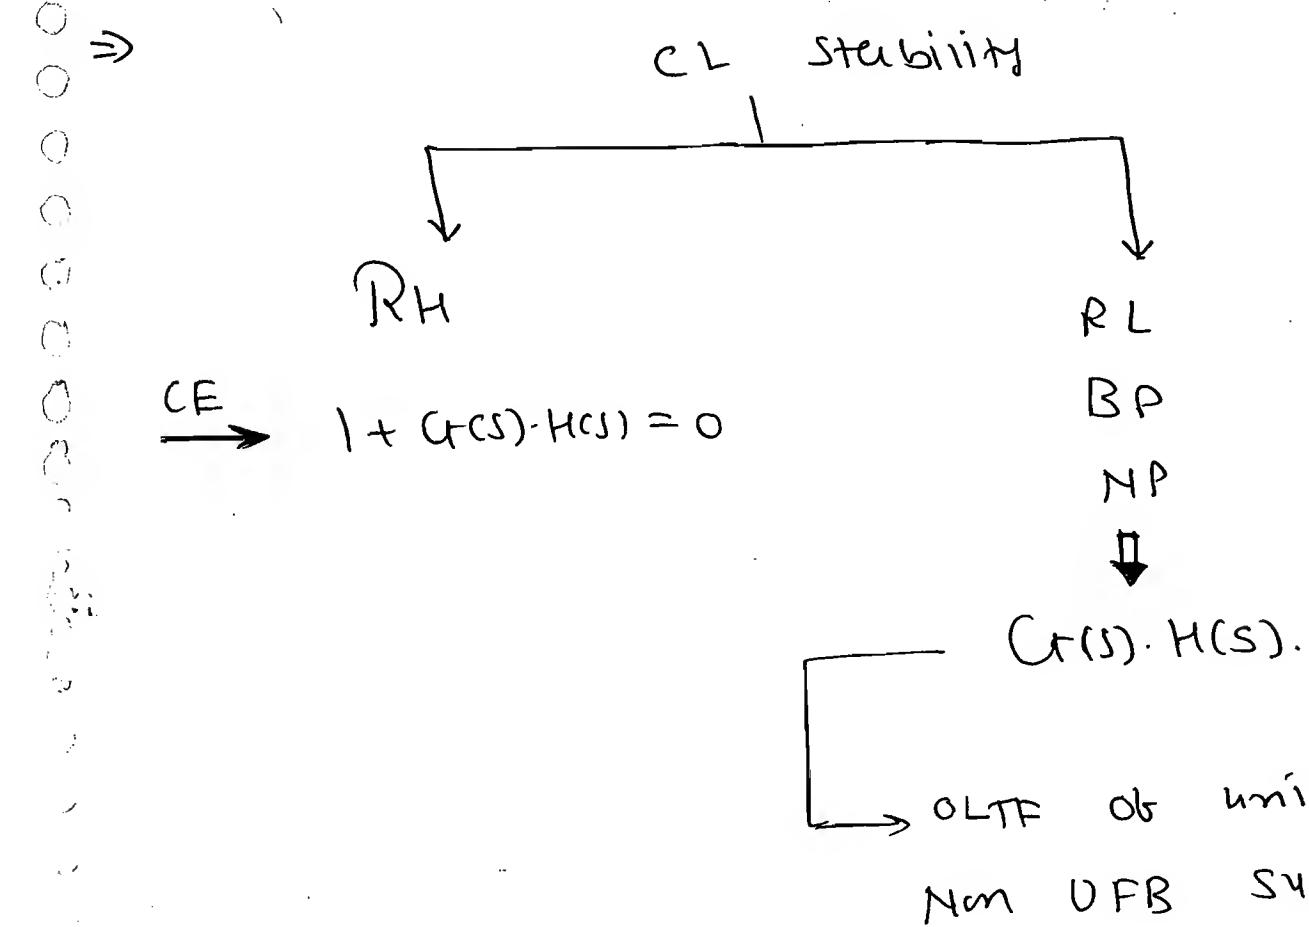

→ By using relative stability concept we can find system time constant, setting time t_s .

⇒ ⑧ To find a CL stability by using RH-criteria required char. eqn.

i.e.

$$1 + G(s) = 0$$

\Rightarrow whereas in remain all the stability techniques required OLTF of a unity (or) Non-UFB system.

\Rightarrow The n^{th} order general form of Char. eqⁿ is,

$$\xrightarrow{\text{CE}} \boxed{a_0 s^n + a_1 s^{n-1} + a_2 s^{n-2} + \dots + a_{n-1} s^1 + a_n s^0 = 0.}$$

a_0, a_1, a_2, \dots are coefficient.

=>

s^n	$a_0 \xrightarrow{②} a_2 \xrightarrow{①} a_4 \xrightarrow{①} \dots$	+/-	+
s^{n-1}	$a_1 \xrightarrow{②} a_3 \xrightarrow{②} a_5 \xrightarrow{②} \dots$	+/-	+
s^{n-2}	$\frac{a_1 a_2 - a_0 a_3}{a_1}$	+/-	-
\vdots	\vdots	\vdots	\vdots
s^0	a_n	+/-	+

(S) Up

=> The condition for the system stability stability, are

① All coefficient in the first column should have same sign and no-coefficient should be '0' in the first column.

② The no. of sign changes in the first column equal to no. of poles in the right plane and the system become unstable.

(c) Find the system stability to the following char. eqn's

$$\textcircled{1} \quad s + 10 = 0.$$

$$\textcircled{2} \quad s^2 + 2s = 0.$$

$$\textcircled{3} \quad s^2 + 10s + 10 = 0.$$

$$\textcircled{4} \quad s^3 + 25s^2 + 8s + 10 = 0.$$

$$\textcircled{5} \quad s^3 + 7s^2 + 6s + 100 = 0.$$

$$\textcircled{6} \quad s^3 + 8s^2 + 4s + 32 = 0.$$

Sol'n:

$$\textcircled{1} \quad s + a = 0.$$

$$\therefore \xrightarrow{\text{CE}} as + b = 0.$$

$$\begin{array}{c|cc} s & a \\ \hline s^0 & b \end{array} \quad \left. \begin{array}{l} a \\ b \end{array} \right\} \quad \begin{array}{l} b, a > 0 \quad (\text{or } \textcircled{S}) \\ b, a < 0 \end{array} \Rightarrow \textcircled{S}$$

$\Rightarrow s + 10 = 0$ is stable.

$$\textcircled{2} \quad s^2 + 2s = 0$$

$$\xrightarrow{\text{CE}} as^2 + bs + c = 0.$$

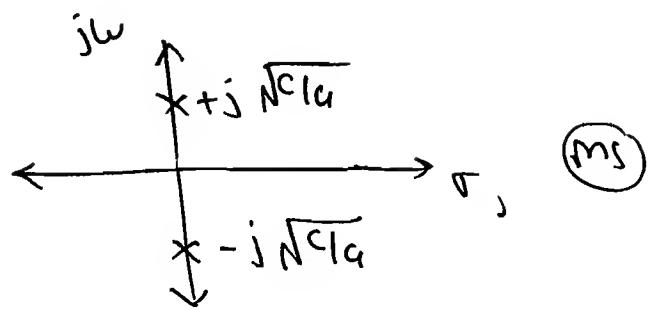

$$\begin{array}{c|cc} s^2 & a \\ \hline s^1 & b \\ \hline s^0 & c \end{array} \quad \begin{array}{l} c \\ \Rightarrow \text{if } a, b, c > 0 \quad (\text{or } \textcircled{S}) \\ a, b, c < 0 \end{array}$$

\Rightarrow if $b = 0, a, c > 0$

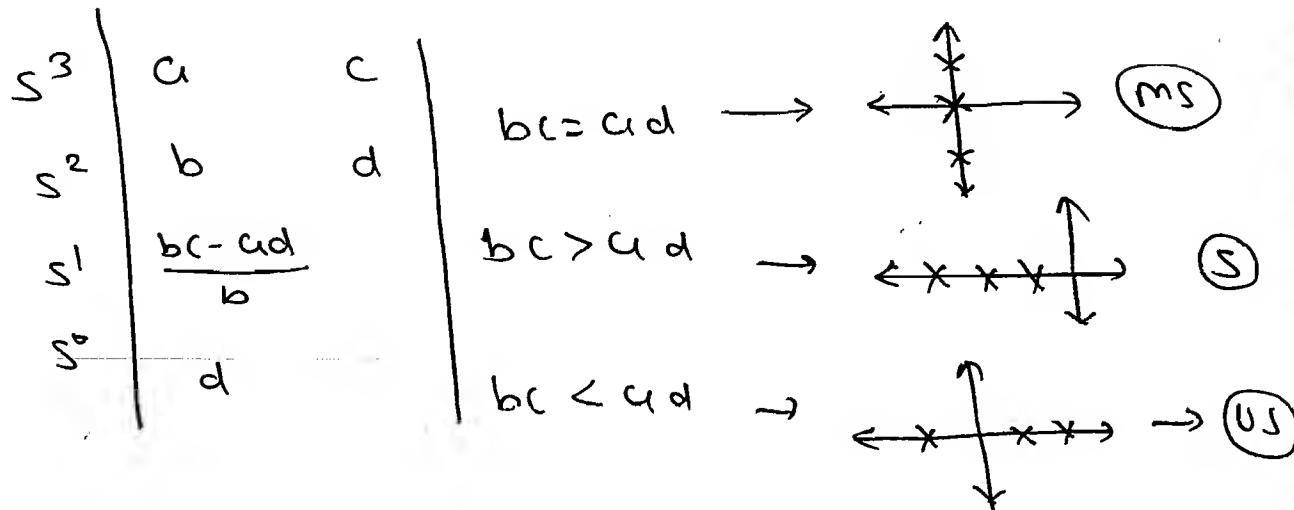

$\Rightarrow \text{MS}$

→

$$\xrightarrow{\text{CE}} as^2 + c = 0 \\ \Rightarrow s = \pm j\sqrt{|c/a|}$$

$$\xrightarrow{\text{CE}} as^3 + bs^2 + cs + d = 0.$$

⇒ even powers of s -terms give f.o.o.

$$bs^2 + d = 0.$$

$$\therefore s = \pm j\sqrt{\frac{d}{b}}$$

$$j\omega_n = \pm j\sqrt{d/b}$$

$\omega_n = \sqrt{d/b} \text{ rad/sec.}$

$$\Rightarrow s^2 + 2s = 0 \Rightarrow \text{MS}$$

$$\textcircled{4} \quad s^3 + 2s^2 + 8s + 10 = 0.$$

$$\rightarrow (bc = 200) > (ad = 10) \Rightarrow \textcircled{5}.$$

$$\textcircled{5} \quad s^3 + 7s^2 + 6s + 100 = 0.$$

$$\rightarrow (bc = 7 \times 6 = 42) < (ad = 100) \Rightarrow \textcircled{US}.$$

$$\textcircled{6} \quad s^3 + 8s^2 + 4s + 32 = 0.$$

$$\rightarrow (bc = 32) = (ad = 32).$$

$\Rightarrow \textcircled{MS}$.

$$\text{F.O.O.} \quad 8s^2 + 32 = 0$$

$$s^2 = 4$$

$$s = \pm j^2$$

$$\therefore \boxed{\omega_n = 2 \text{ rad/sec}}$$

a Find the no. of poles in the right of s -plane to the given char. eqn.

$$s^4 + 2s^3 + 3s^2 + 4s + 5 = 0.$$

Soln:

	s^4	1	3	5
	s^3	2	4	
①	s^2	1	5	$2R, 1C$
②	s^1	-6		$2R, 1C$

\Rightarrow 2 sign changes.

hence 2 poles lies on RHS plane
System Unstable.

\Rightarrow Total 4 pole and 2 left & 2 Right.

Q Find the no. of poles on Right to the given char. eqn:

① $s^4 + 2s^3 + 3s^2 + 2s + 1 = 0$.

Soln:

s^4	1	3	1
s^3	2	2	
s^2	2	1	
s^1	1		
s^0	1		

No sign change.

\rightarrow Satisfable

\rightarrow No Poles on
RH s-plane.

\rightarrow 4 Poles on
LH s-plane.

② $s^4 + 2s^3 + 3s^2 + s + 2 = 0$.

Soln:

s^4	1	3	2
s^3	2	1	
s^2	$s/2$	2	
s^1	$-3/s$		
s^0	2		

\rightarrow 2 sign changes

\rightarrow System \Rightarrow UJ

\rightarrow 2 poles on RH
s-plane.

\rightarrow 2 poles on LH s-plane.

$$\textcircled{3} \quad s^4 + 2s^3 + 2s^2 + 4s + 8 = 0.$$

Soln:

s^4	1	2	8
s^3	2	4	
s^2	$\cancel{0}$	8	
s^1	$\frac{4s+16}{s}$		$-\infty$
s^0	8		

$$\lim_{\epsilon \rightarrow 0} \frac{4\epsilon+16}{\epsilon} = -\infty.$$

\rightarrow 2-sign changes, 2-poles on Rh-plane.
2-pole) on Lh-plane.

Difficulty- I

\Rightarrow Whenever any one element is '0',
Replace '0' by smallest positive constant
 ϵ and continue the Routh Stability.
Finally for $\epsilon = 0$. Check the no. of sign
changes.

$$\textcircled{4} \quad s^5 + s^4 + 2s^3 + 2s^2 + 3s + 15 = 0.$$

s^5	1	2	3
s^4	1	2	15
s^3	$\cancel{0}$	-12	0
s^2	$\frac{2\epsilon+12}{\epsilon}$	15	$-\infty$
s^1	$\frac{-12A-15\epsilon}{A}$		$-\infty$
s^0	15		

$$\lim_{\epsilon \rightarrow 0} \frac{2\epsilon+12}{\epsilon} = \infty.$$

$$\lim_{\epsilon \rightarrow 0} -12 - \frac{15\epsilon}{A} = -12.$$

2-sign changes

2-poles on Rh-plane

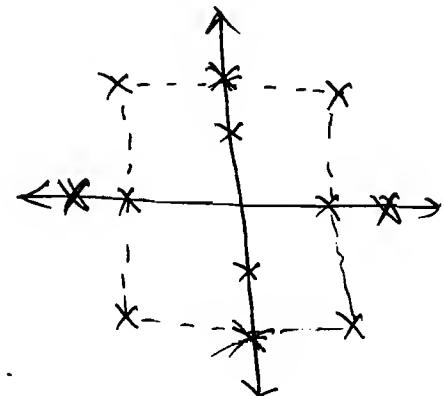

$$\textcircled{5} \quad s^5 + s^4 + 3s^3 + 3s^2 + 2s + 2 = 0.$$

Sum:

s^5	1	3	2	
s^4	1	3	2	$\leftarrow AE: 1 \cdot s^4 + 3s^2 + 2 = 0.$
s^3	0 (4)	0	0	
s^2	$\frac{3}{2}$	2		$\therefore \frac{dAE}{ds} = 4s^3 + 6s.$
s^1	$\frac{2}{3}$			
s^0	2			

$$AE: 1 \cdot s^4 + 3s^2 + 2 = 0. \rightarrow$$

System \rightarrow Marginally stable.

Difficulty - 2:

\Rightarrow Whenever in the Routh table form Row of zero occurs then we required to form the Auxiliary eqn by using the above row of zero coefficients and differentiate the Auxiliary equation and replace zeros by the coefficients of differential auxiliary eqn and continue the Routh Stability.

\rightarrow In the Routh table form row of zero occurs means the pole must lies

Summetrical about the origin.

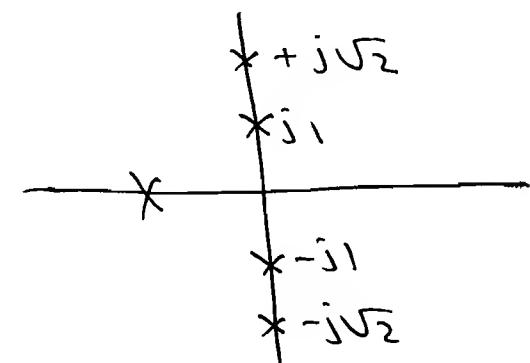

⇒ The Auxiliary eqn must consist only even power of S-terms because the Roots of Auxiliary eqns must be symmetrical about origin.

→ The roots of auxiliary eqn are CL poles which are symmetrical,

$$s^4 + 3s^2 + 2 = 0$$

$$\therefore (s^2+1)(s^2+2) = 0$$

$$s = \pm j1, s = \pm j\sqrt{2}$$

⇒ Non-repeated poles on jw-axis hence MS .

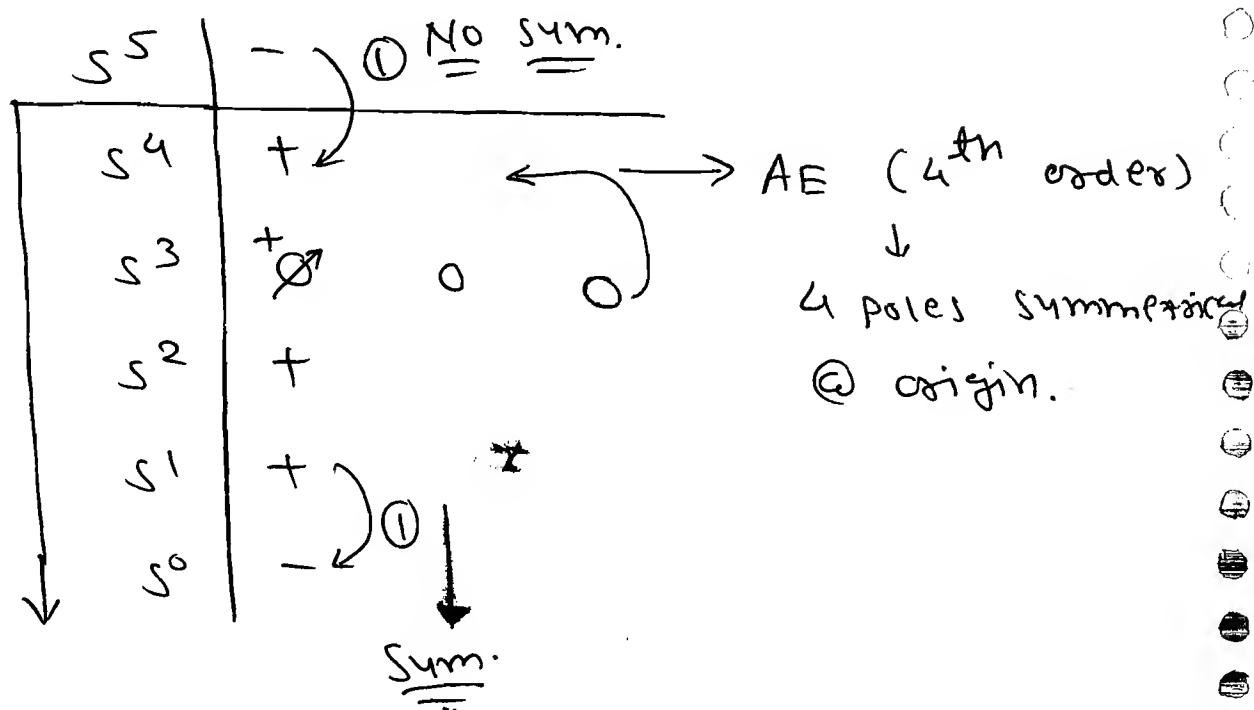

⇒ Whenever in the Routh tabular form only once the Row of zero occurs and all the co-efficients in the 1st column are +ve then the system is Marginal Stable because the poles must lies on the imaginary axis which are non-repeated.

→ 1 time Row of zero occurs means

the poles are symmetrical about the origin but not repeated.

⇒ The no. of time Zeros at zero indicates no. of poles are repeated.

⇒

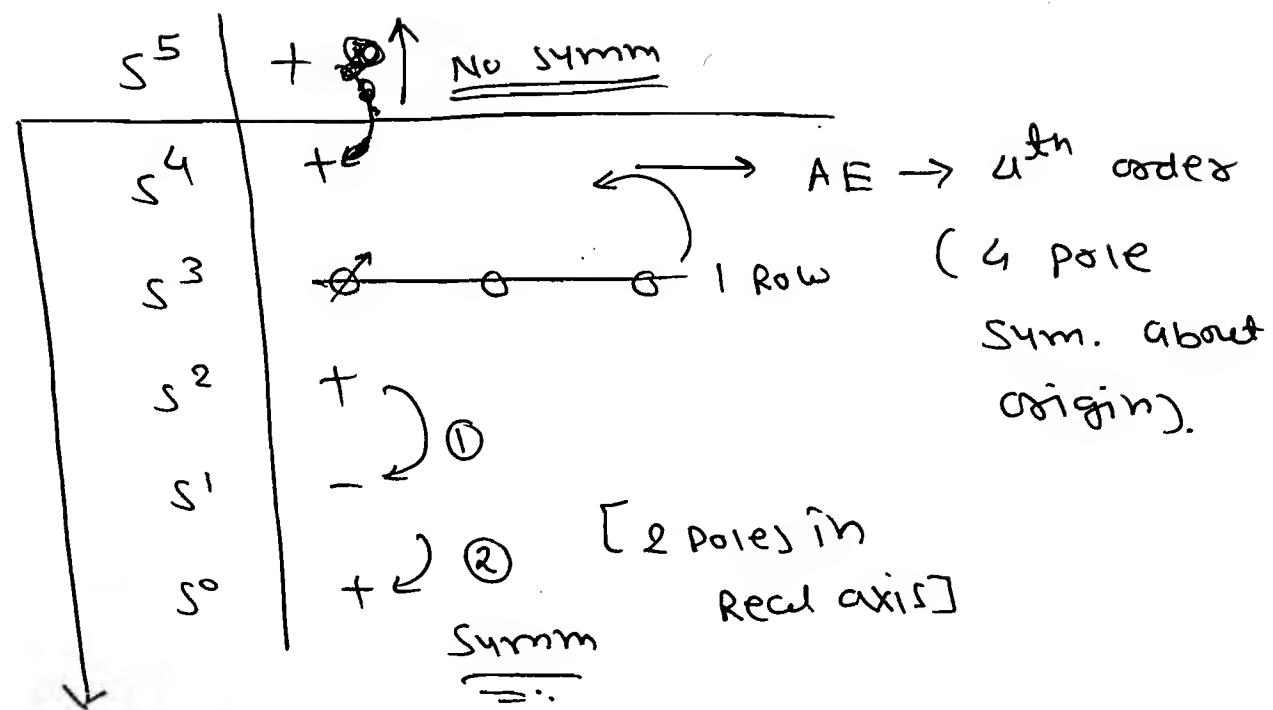

Note:

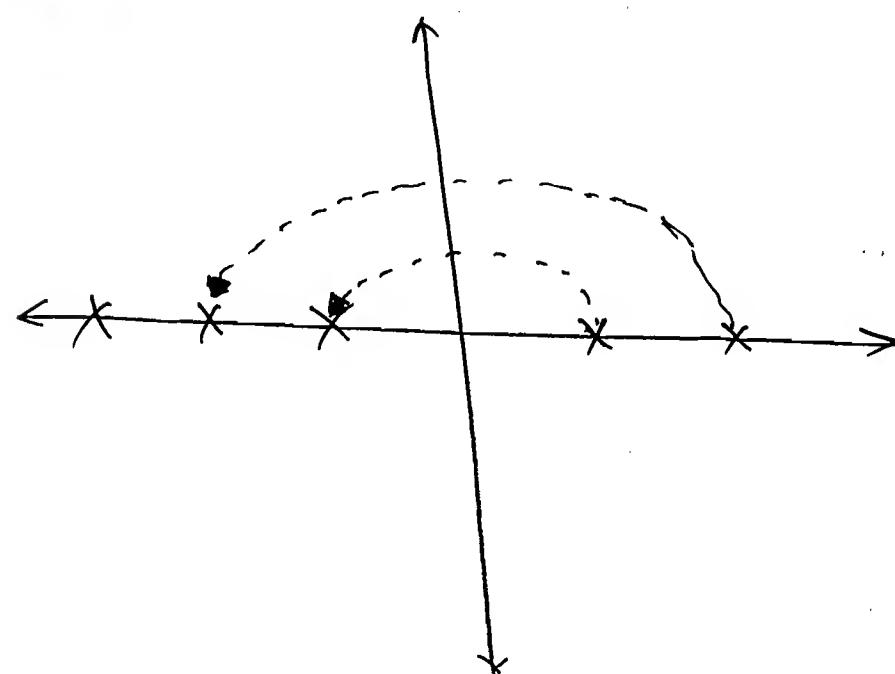

⇒ The sign change occurs below the AE there must be a symmetrical pole in the left to the pole placed in Right.

⇒ The sign change occurs above the Auxiliary eqn there is no symmetrical pole in the left to the pole placed in the Right side.

\Rightarrow

\Rightarrow

[ce]

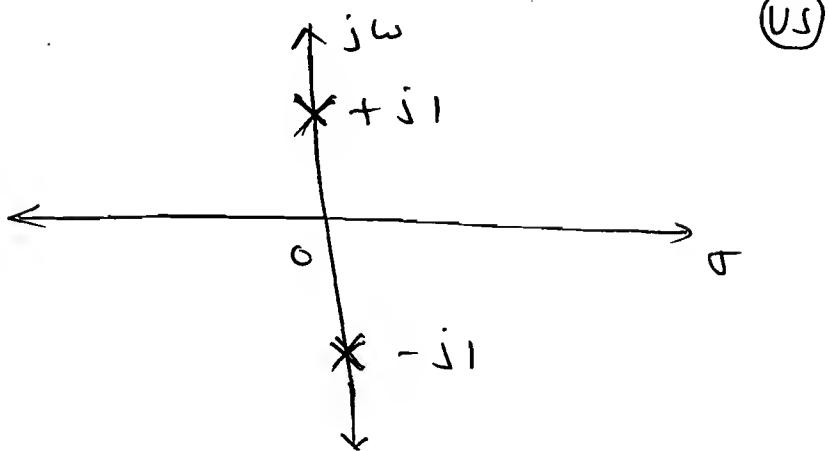

$$s^6 + 3s^5 + 4s^4 + 6s^3 + 5s^2 + 3s + 2 = 0.$$

Sgn:

s^6	1	4	5	2
s^5	3	6	3	
s^4	2	4	2	$\rightarrow AE_1 \Rightarrow 2s^4 + 4s^2 + 2 = 0.$
s^3	8	8	0	$\rightarrow 1^{\text{st}} \text{ zero.}$
s^2	2	2		$\rightarrow AE_2 \Rightarrow 2s^2 + 2 = 0$
s^1	0	0		$\rightarrow 2^{\text{nd}}$ zero. Repeated nature of pole.
s^0	2			

$$AE_2: \alpha s^2 + \alpha s^0 = 0$$

$$s = \pm j\omega$$

\Rightarrow Whenever many times Row of Zeros occurs and all the Co-efficients in the 1st Column are positive then the system is unstable the poles must lies on the imaginary axis which are repeated.

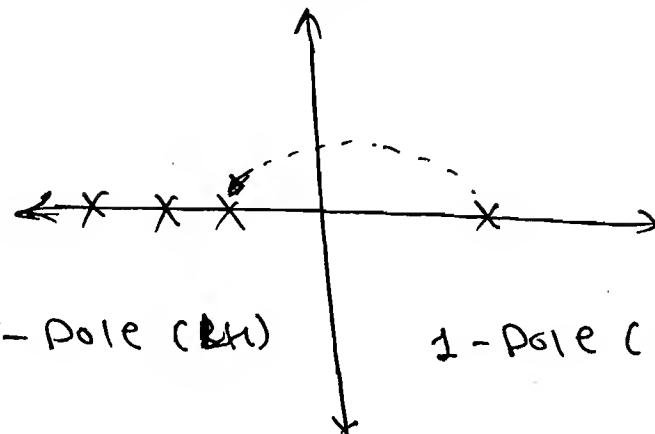

a) Find the no. of poles in the Right half right of s-plane to the given char. eqn $s^4 + s^3 - s - 1 = 0$.

Sum:

s^4	1	0	-1	
s^3	1	-1		
s^2	1	-1		AE: $s^2 - 1 = 0$
s^1	0	0	1 Row	$s = \pm 1$
s^0	-1	1		$s = \pm 1$

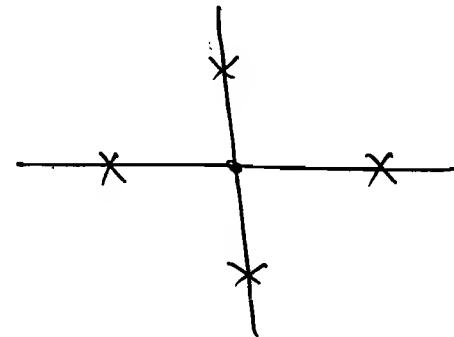

① - sign Change below AE.

Hence, Symmetrical pole.

a) Identify the Routh tabular form to the given poles locations in the s-plane.

①

Soln: \Rightarrow 4 pole are symmetrical \rightarrow 1 Row of zero.

\Rightarrow 1 pole below AE RH \rightarrow 1 sign change.

below AE because symm. Pole in the left side.

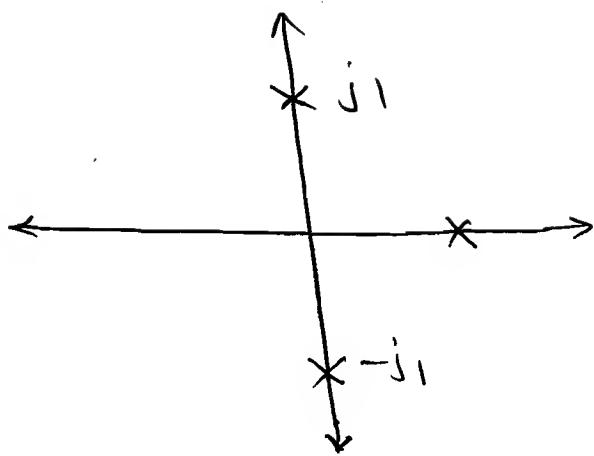

$$\therefore (s^2-1)(s^2+1)=0.$$

$$s^4 - 1 = 0$$

$$\begin{array}{c|cccc} s^4 & 1 & 0 & -1 & \\ \hline s^3 & \cancel{s^4} & 0 & 0 & \xrightarrow{\text{AE: } s^4-1=0 \text{ (4th order)}} \\ s^2 & \cancel{s^4} & -1 & -1 & \\ s^1 & -4 & \cancel{0} & \lim_{\epsilon \rightarrow 0} -\frac{4}{\epsilon} \leftarrow \infty & \\ s^0 & -1 & & & \end{array}$$

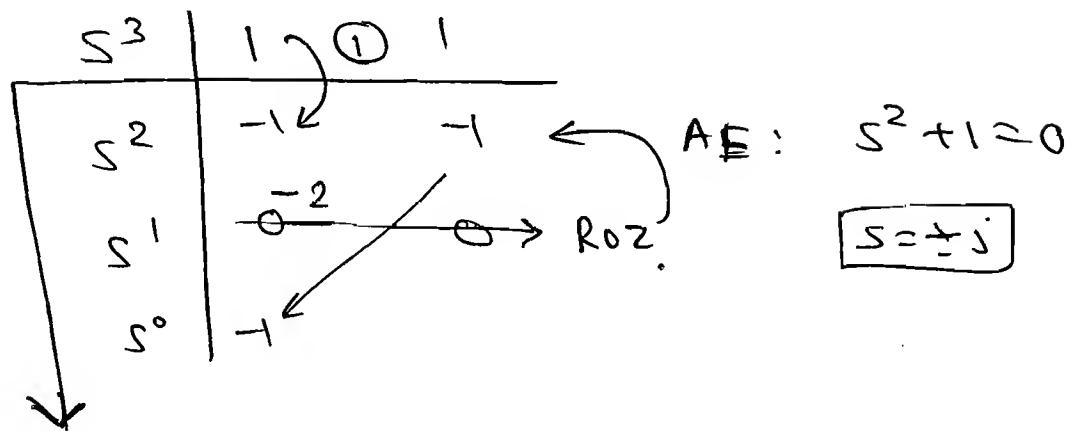

1 Row of zero.

(2)

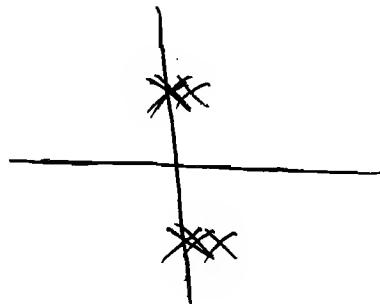

$$S_{01^n}: (s^2 + 1)(s - 1) = 0.$$

CE $\rightarrow s^3 - s^2 + s - 1 = 0.$

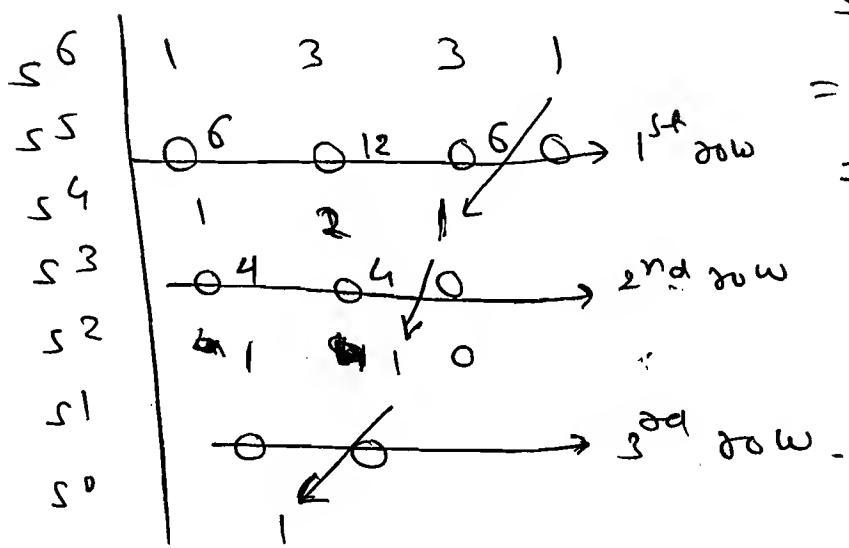

(3)

$$(s^2 + 1)^3 = 0.$$

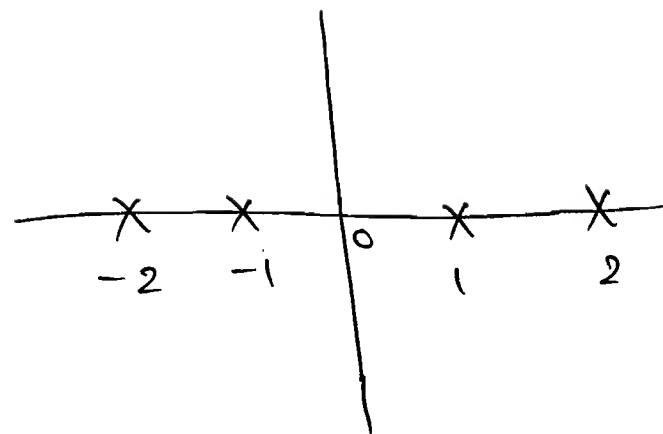

$$S_{01^n}:$$

$$\begin{aligned} s &= \pm j1, \pm j1, \pm j1 \\ &= s^6 + 1 + 3s^4 + 3s^2 \\ &= s^6 + 3s^4 + 3s^2 + 1 \end{aligned}$$

a

HW

Soln: 4 Poles are symmetric about the real axis and 1 Row of zeros.

Two poles are RH plane and sum.
Hence 2 sign changes below the AE.

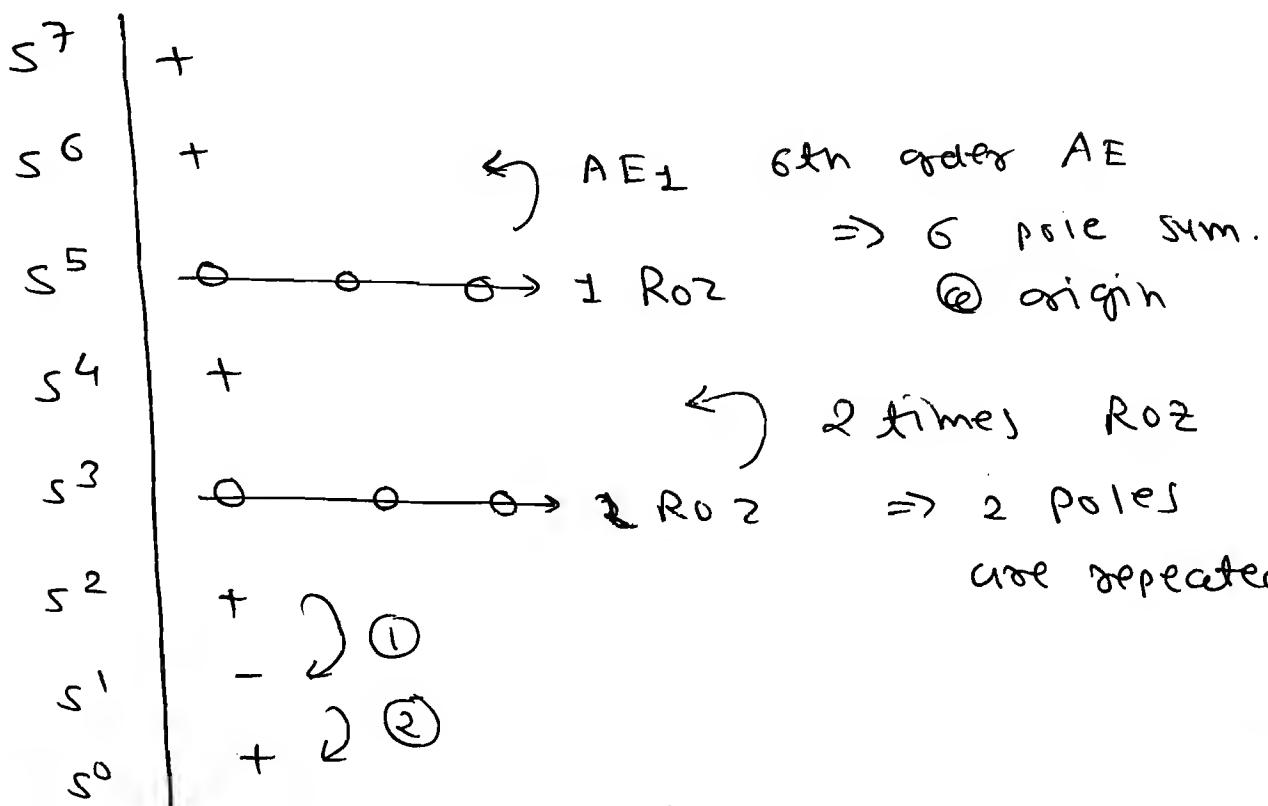

$$\Rightarrow CE \rightarrow (s^2 - 1)(s^2 - 4) = 0.$$

$$\therefore s^4 - 5s^2 + 4 = 0.$$

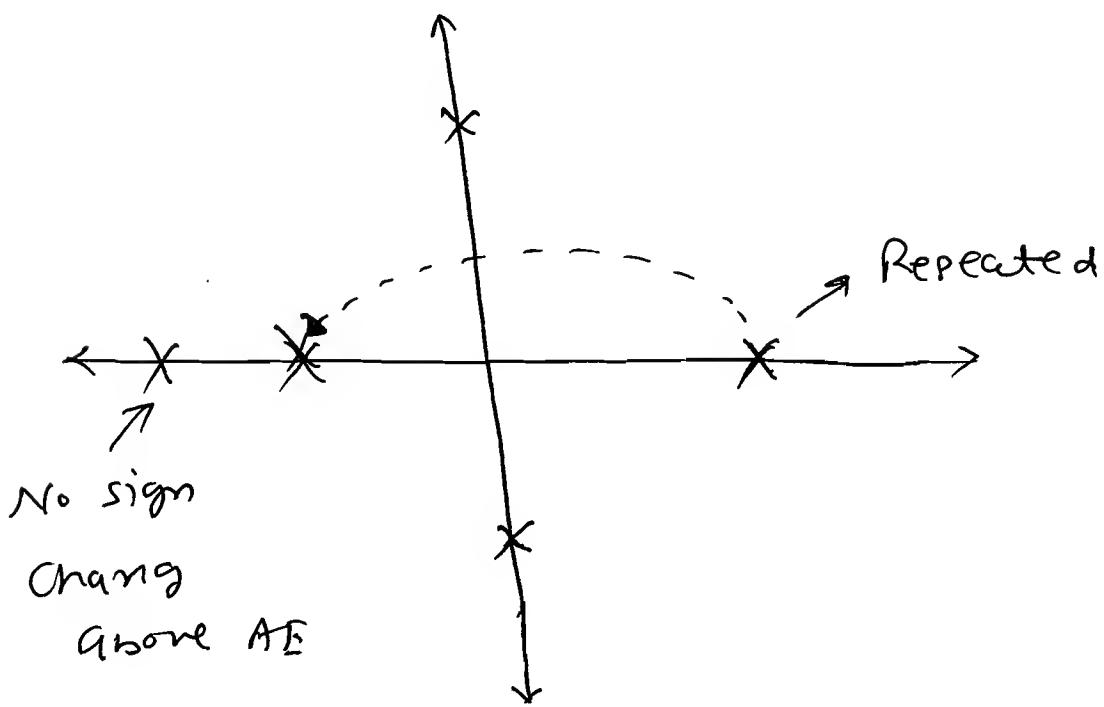

s^4	1	-5	4	AE
s^3	0	-10	0	$\rightarrow 1 R_0 2$
s^2	-5/2	4		
s^1	18/5			
s^0	4			

① ②

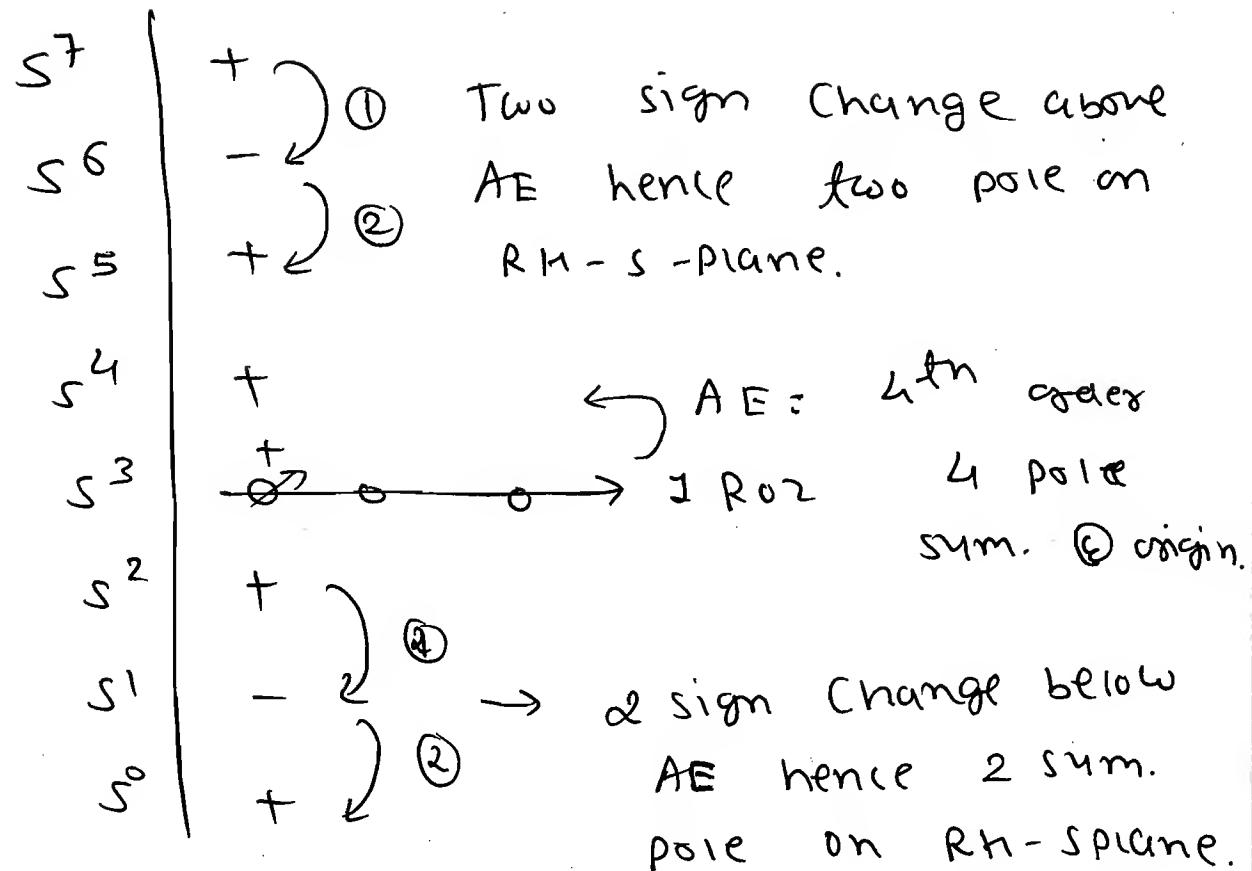

① Identify the no. of poles on the imaginary axis, in the left and Right ^{of s} plane to the given sample Routh tabular form:

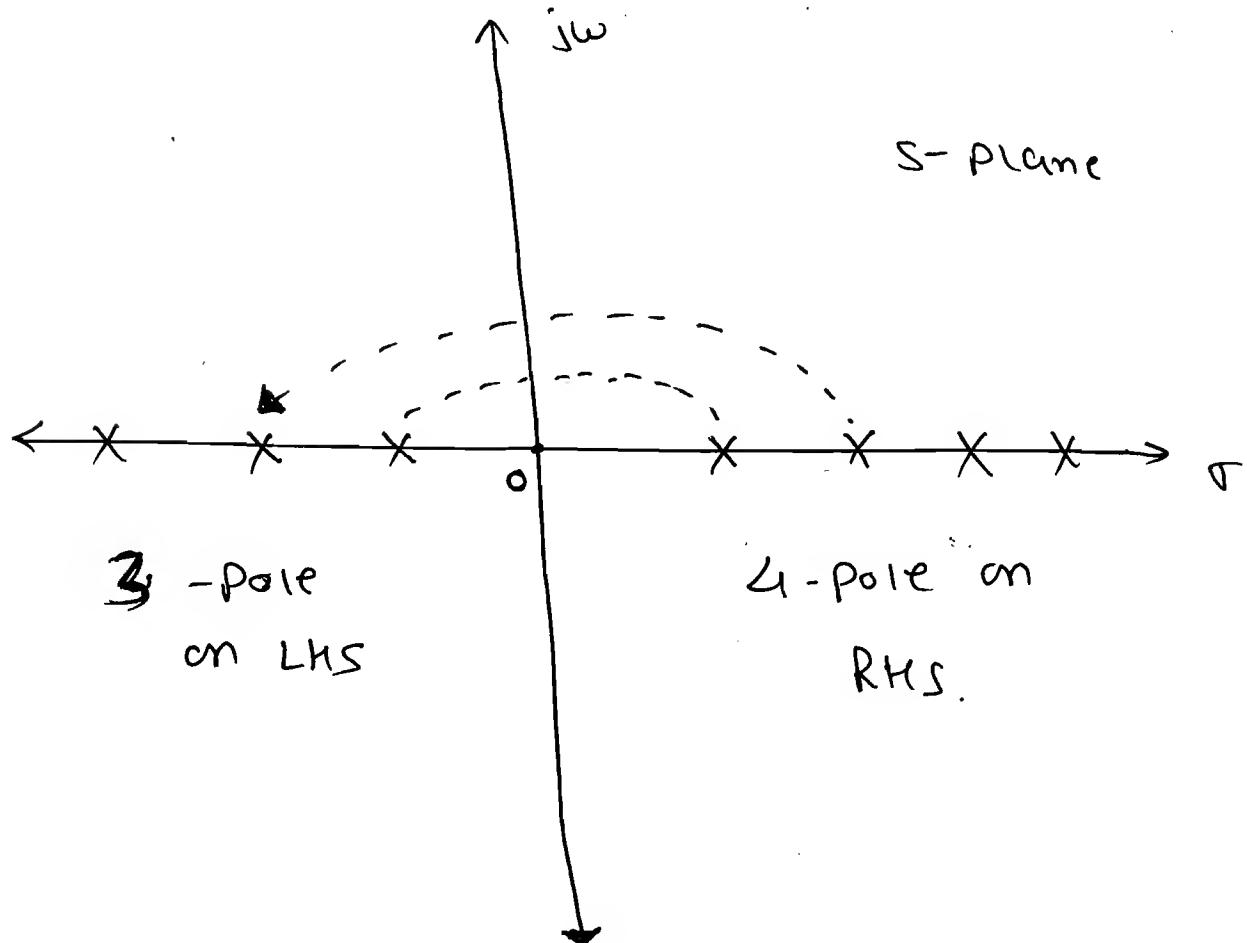

Sgn:

(2)

SOLN:

* Conditional Stable System:-

- Find the range of k value for system stability.
- Find the k value to become the system marginally stable ($\underline{\text{or}}$) Undamped system.
- Find the natural freqⁿ of oscillation when the system is marginal stable to the char. eqn.

$$s^3 + 8s^2 + 4s + k = 0.$$

Solⁿ:

$$\begin{array}{c|cc} s^3 & 1 & 4 \\ \hline s^2 & 8 & k \\ \hline \text{(M)} \rightarrow s^1 & \frac{32-k}{8} > 0 & \text{(S)} \\ x s^0 & k > 0 & \text{(S)} \end{array}$$

→ For stable, ~~$32 >$~~

$$\frac{32-k}{8} > 0 \quad \boxed{k > 0}$$

$$\Rightarrow 32 - k > 0 \quad \text{So,} \quad \boxed{0 < k < 32}$$

$$\boxed{k < 32}$$

(S)

For, ms_1 ,

$$\frac{32 - K}{8} = 0 \\ \Rightarrow K = 32 \Rightarrow K_{\text{marg.}} = 32$$

Note:

\Rightarrow For K marginal value consider only odd powers of s power polys.

$$AE \rightarrow 8s^2 + K = 0 \\ 8s^2 = -K_{\text{marg.}} \\ s^2 = -32/8 \\ s = \pm j2.$$

$$j\omega_n = \pm j2 \\ \Rightarrow \omega_n = 2 \text{ rad/sec}$$

(a) $2s^3 + 5s^2 + 10s + (K+5) = 0$.

Solⁿ:

s^3	2	10
s^2	5	$K+5$
s^1	$\frac{50 - 2(K+5)}{s}$	
s^0	$K+5$	

\rightarrow For Stab.,

$$\frac{40 - 2K}{5} > 0$$

$$40 > 2K \Rightarrow$$

$$K < 20$$

$$K+5 > 0$$

$$K > -5$$

$$-5 < K < 20 \Rightarrow (S)$$

\Rightarrow For MS,

$$\frac{40 - 2K}{s} = 0$$

$$K_{max} = 20$$

$$AE \rightarrow 5s^2 + K + 5 = 0$$

$$5s^2 + 2s = 0$$

$$s^2 = -s$$

$$s = \pm j\sqrt{s}$$

$$\therefore \omega_n = \sqrt{s} \text{ rad/sec}$$

Another

method:

$$2s^3 + 5s^2 + 10s + (K+5) = 0$$

$2K + 10$

$5s$

$$\therefore 2K + 10 = 5s$$

$$K = 20/2$$

$$\Rightarrow K_{max} = 20$$

(Q) Repeat the above problem for given

$$G_H(s) = \frac{K}{s(s+2)(s+4)(s+6)}$$

Solⁿ:

$$CE \rightarrow 1 + G_H(s) = 0.$$

$$s(s+2)(s+4)(s+6) + K = 0.$$

$$\therefore (s^2 + 2s)(s^2 + 10s + 24) + K = 0.$$

$$\Rightarrow s^4 + 10s^3 + 24s^2 + 2s^3 + 20s^2 + 48s + K = 0.$$

$$\therefore s^4 + 12s^3 + 44s^2 + 48s + K = 0.$$

$$\begin{array}{c|cccc} s^4 & 1 & 44 & K \\ \hline s^3 & 12 & 48 & \\ s^2 & 40 & K & \\ s^1 & \frac{160-K}{40} & & \\ s^0 & K & & \end{array}$$

\Rightarrow For, Stable,

$$K > 0 \quad \text{and} \quad \frac{160-K}{40} > 0 \Rightarrow K < 160$$

$$\therefore 0 < K < 160 \Rightarrow \textcircled{S}.$$

\Rightarrow For (ms) ,

$$\therefore \frac{160 - K_{max}}{40} = 0$$

$$\therefore K_{max} = 160.$$

$$AE \rightarrow 40s^2 + K_{max} = 0$$

$$\therefore 40s^2 + 160 = 0.$$

$$s^2 = -4.$$

$$\Rightarrow s = \pm 2j.$$

$$\Rightarrow \omega_n = 2 \text{ rad/sec}$$

(a) Find k and b values so that

the $G(s) = \frac{k(s+1)}{s^3 + bs^2 + 3s + 1}$, $H(s) = 1$

oscillates with a freq. of 2 rad/sec.

Sgn:

$$\omega_n = 2 \text{ rad/sec}$$

$$\Rightarrow \text{ms}$$

$$CE \rightarrow 1 + G H(s) = 0.$$

$$\therefore 1 + \frac{k(s+1)}{s^3 + bs^2 + 3s + 1} = 0.$$

$$\therefore s^3 + bs^2 + 3s + 1 + ks + k = 0.$$

$$s^3 + bs^2 + (k+3)s + (k+1) = 0.$$

$$\begin{array}{c|cc} s^3 & 1 & k+3 \\ s^2 & b & (k+1) \\ s^1 & \frac{b(k+3)-(k+1)}{b} \\ s^0 & k+1 \end{array}$$

$$\Rightarrow \text{For ms, } \frac{b(k+3)-(k+1)}{b} = 0.$$

$$\therefore b(k+3) - (k+1) = 0$$

$$b = \frac{k+1}{k+3} - \textcircled{1}$$

$$\therefore AE \rightarrow bs^2 + (k+1) = 0.$$

$$\therefore s^2 = -\left(\frac{k+1}{b}\right).$$

$$\therefore s = \pm j \sqrt{\frac{k+1}{b}}.$$

$$\Rightarrow \omega_n = \sqrt{\frac{k+1}{b}} = 2 \text{ rad/sec.}$$

$$\therefore \zeta = \frac{k+1}{b}.$$

form - eqn ①

$$\zeta = \frac{k+1}{k+3} \times k+3$$

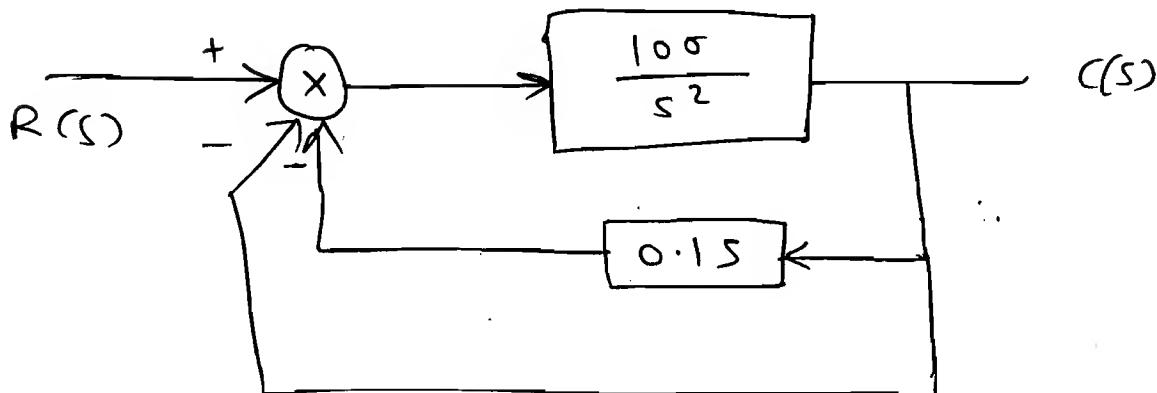

$$k=1 \quad \checkmark$$

$$\therefore b = \frac{k+1}{4}$$

$$\Rightarrow b = 1+1/4$$

$$b = 0.5 \quad \checkmark$$

ce Check the Stability to the given Bo.

$$\text{SOLN: } \text{Char. eqn} \quad 1 + G_H(s) = 0.$$

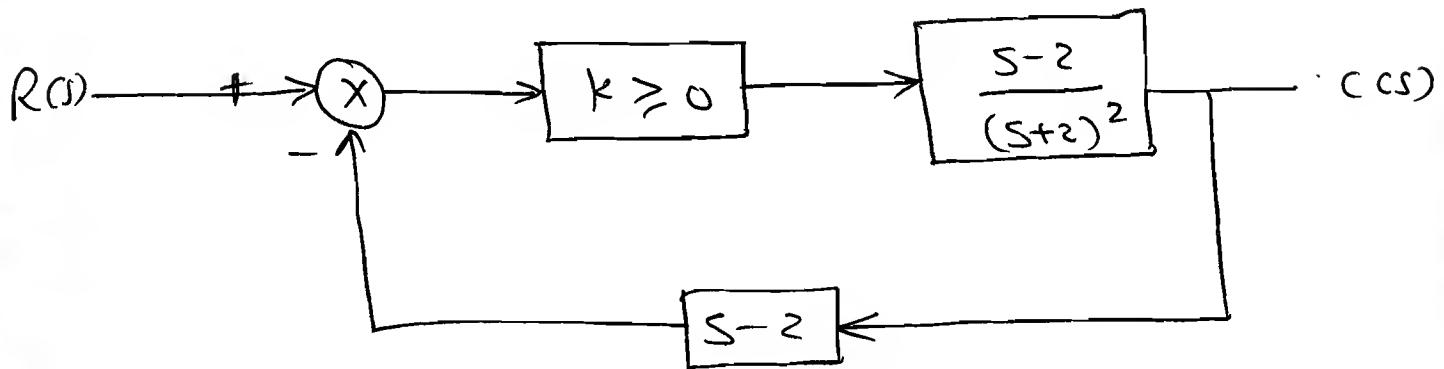

$$\therefore 1 + \frac{100}{s^2} [1 + 0.15] = 0.$$

$$\therefore 1 + \frac{10}{\frac{100}{s^2}} \left[\frac{s+10}{10} \right] = 0$$

$$\Rightarrow s^2 + 10s + 100 = 0.$$

$$\begin{array}{c|cc} s^2 & 1 & 100 \\ s^1 & 10 & \searrow \\ s^0 & 100 & \end{array} \quad \text{No sign Change.} \Rightarrow (s).$$

Q Find the range of K value for system to be stable.

Soln: CE $\rightarrow 1 + G_H(s) = 0.$

$$\therefore 1 + \frac{K(S-2)^2}{(S+2)^2} = 0.$$

$$\therefore S^2 + 4s + 4 + KS^2 - 4KS + 4K = 0$$

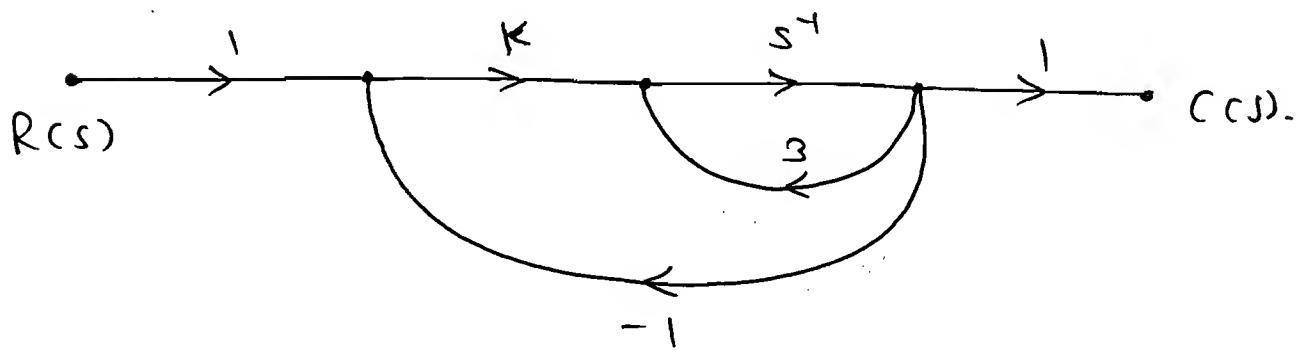

$$\therefore S^2(1+K) + S(4-4K) + 4K + 4 = 0$$

$$\begin{array}{l|ll} s^2 & 1+k > 0 & k+4k \\ \hline s^1 & k-4k > 0 \\ s^0 & k+4k > 0 \end{array}$$

$$\Rightarrow \begin{array}{l|l|l} k+1 > 0 & k-4k > 0 & k+4k > 0 \\ k > -1 & k > 4k & k > -4k \\ \varphi & k < 1 & k \geq -1 \end{array}$$

So, $0 \leq k < 1$ ($\because k \geq 0$ given).

(a) Find the range of k value.

Soln:

$$(E \rightarrow) 1 + GH(s) = 0.$$

$$\therefore 1 - 3s^{-1} + ks^{-1} = 0$$

$$1 - 3/s + k/s = 0.$$

$$\therefore s + (k-3) = 0.$$

for (5), $k-3 > 0$

$$k > 3$$

(a) The Loop Gain of the system

$$G_H = \frac{K}{s(s+1)(s+2)}, \text{ the value of } K$$

for which the system just becomes
the unstable is, -?

Soln: CE $\rightarrow 1 + G_H(s) = 0.$

$$\therefore 1 + \frac{K}{s(s+1)(s+2)} = 0.$$

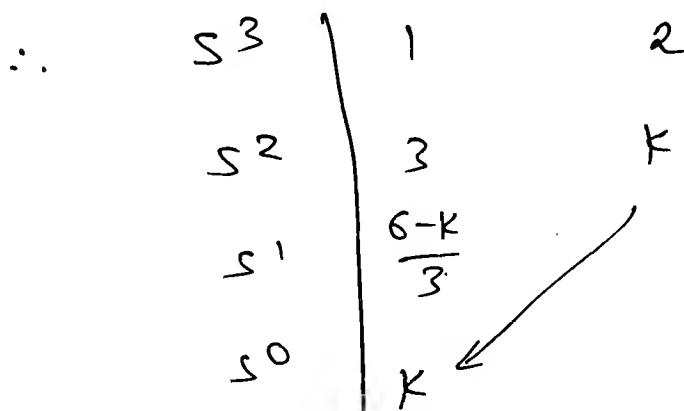

$$\therefore s(s^2 + 3s + 2) + K = 0.$$

$$\therefore s^3 + 3s^2 + 2s + K = 0.$$

\Rightarrow just becomes the Unstable

Marginal Stable.

For, (ms) $\frac{6-K}{3} = 0$

$$\Rightarrow [K_{\max} = 6]$$

(Q) A system has $G(s) = \frac{K}{s^3 + 8s^2 + 4s}$

$H(s) = 1$. For what value of K the system will produce continuous osc?

Soln:

$$1 + G(H(s)) = 0.$$

$$\therefore 1 + \frac{K}{s^3 + 8s^2 + 4s} = 0.$$

$$\therefore s^3 + 8s^2 + 4s + K = 0.$$

Contⁿ oscillation \rightarrow m_s .

$$\begin{array}{c|cc} s^3 & 1 & 4 \\ s^2 & 8 & K \\ s^1 & \frac{32-K}{8} & \\ s^0 & K & \end{array}$$

for m_s , $\frac{32 - K_{\max}}{8} = 0$.

$$\Rightarrow [K_{\max} = 32]$$

Another method:

$$s^3 + 8s^2 + 4s + K = 0$$

$$\therefore [K = 32]$$

Relative

Stability.

⇒ The Relative Stability Concept applicable for only stable system.

(Q) A system has $G(s) = \frac{2}{s(s+1)(s+2)}$

$H(s) = 1$. With RH criteria determine its relative stability about the line

$$s = -1. \quad [0]$$

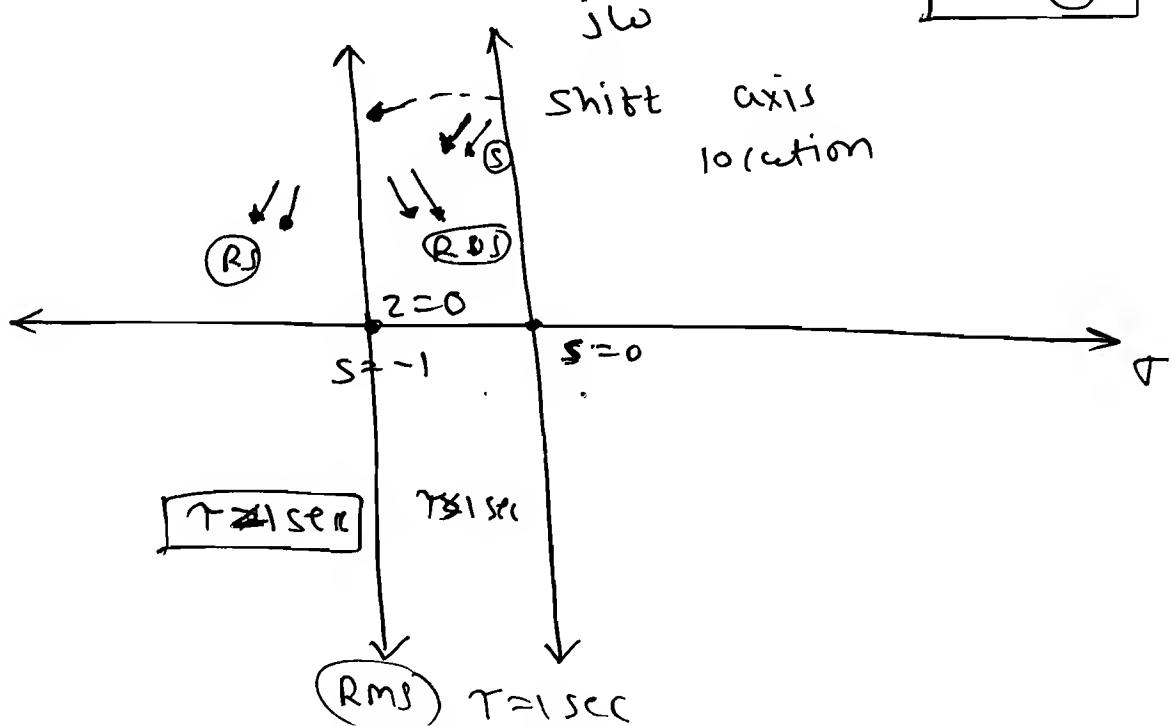

Check whether the time const. greater (∞) lesser ($\underline{\infty}$) equal to 1 sec to the given system.

Soln:

$$(E \rightarrow) 1 + G_H(s) = 0$$

$$\Rightarrow s^3 + 3s^2 + 2s + 2 = 0.$$

$$\begin{array}{|c|} \hline s > 2 \\ \Rightarrow (S) . \\ \hline \end{array}$$

$$\Rightarrow S+1=0=2$$

$$\therefore \boxed{S = 2-1}$$

$$\therefore G(z) = \frac{2}{(z-1)(z)(z+1)}.$$

$$\therefore 1 + G(z) \cdot H(z) = 1 + \frac{2}{z(z^2-1)}$$

$$= z^3 - z + 2.$$

$$\begin{array}{c|cc} z^3 & 1 & -1 \\ z^2 & \cancel{\infty} & 2 \\ \textcircled{1} \downarrow z^1 & -\cancel{\infty} & \cancel{-\infty} \\ \textcircled{2} \downarrow z^0 & \cancel{2} & 2 \end{array}$$

Two sign change betⁿ $S=0$ & $S=-1$.

2 posse betⁿ $S=0$ & $S=-1$.

$\Rightarrow S = z + \text{Axis shift location}$

$$S = (z - \gamma)$$

$$(R_S) \Rightarrow (\gamma) < ()$$

$$(R_{MS}) \Rightarrow \gamma = ()!$$

$$(R_{US}) \Rightarrow \gamma > ()$$

* Limitation of RH criteria:

- ① The exact location of pole can not be determine.
- ② The RH criteria is not applicable for exponential sine ($\sin \omega t$) cosine terms because it gives the infinite series.
- ③ RH criteria is applicable to finite no. of terms.

Note: By using RH criteria we can get approximation soln to exponential term.

Q Find the value of K for stability.

$$G(s) \cdot H(s) = \frac{k \cdot e^{-s\tau}}{s(s+1)}$$

$$\text{Soln: } (E \Rightarrow 1 + G_H(s) = 0 \Rightarrow 1 + \frac{k \cdot e^{-s\tau}}{s(s+1)} = 0)$$

$$\Rightarrow 1 + \frac{k(1 - s\tau)}{s(s+1)} = 0$$

$$\Rightarrow s^2 + s + k - ks\tau = 0$$

$$\Rightarrow s^2 + (1 - k\tau)s + k = 0.$$

$$\begin{array}{c|cc}
 s^2 & 1 & K \\
 s^1 & 1 - K\tau & \\
 s^0 & K \\
 \hline
 \end{array}$$

$1 - K\tau > 0, K > 0$
 $K < \frac{1}{\tau}$
 $\therefore \Rightarrow 0 < K < \frac{1}{\tau}$ for (S).

★ Root Locus :-

Purpose:-

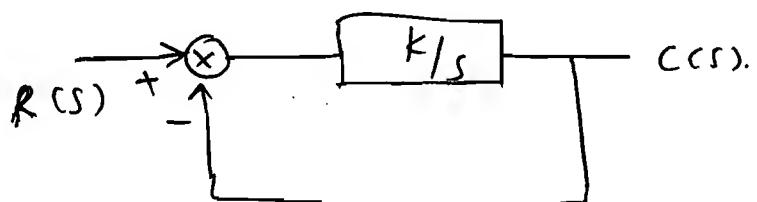

- To find the CL system stability.
- To find the range of K value for system stability.
- To find the K value to become System Marginal stable.
- To find the natural freq. of oscillation (or) Undamped oscillation when the system is marginal stable.
- To find the K value to become the System undamped, underdamped, critical damped and overdamped system.
- To find the relative stability. By using the relative stability concept we can find system time constant setting time.

- If the Root locus branches moves towards the left then the system is more Relative Stable.
- If the Root locus branches moves towards the Right then the system is less Relative Stable.
- Best method to find the relative stability is Root Locus.
- Best method to find absolute stability is Rh-criteria.

* Definition of Root Locus:

- 'Root' means roots of char. eqn which is CL Poles. 'Locus' means path. Hence, Root Locus means CL poles path by varying K value from 0 to ∞ .

Draw the Root locus to the given system.

Soln: char. eqn $\Rightarrow 1 + G_K(s) = 0$.

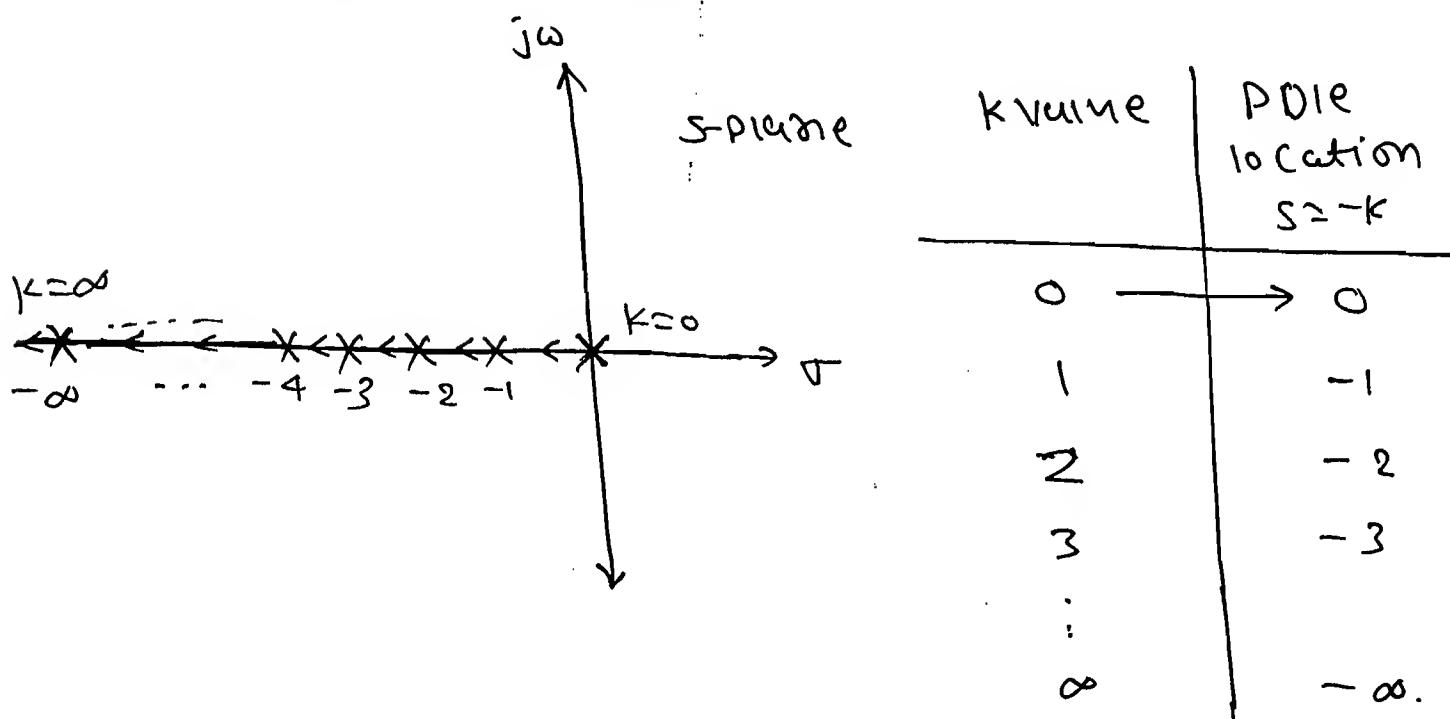

$$\Rightarrow 1 + \frac{K}{s} = 0$$

$$s + K = 0.$$

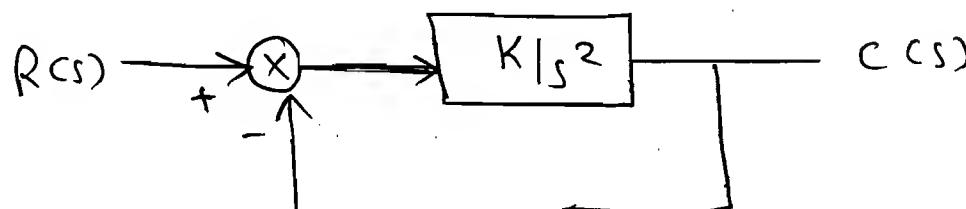

→ drawing a root locus means identifying the CL poles path.

$$s = -K$$

→ CL poles path is given by char. eqn.

[a] Draw Root Locus.

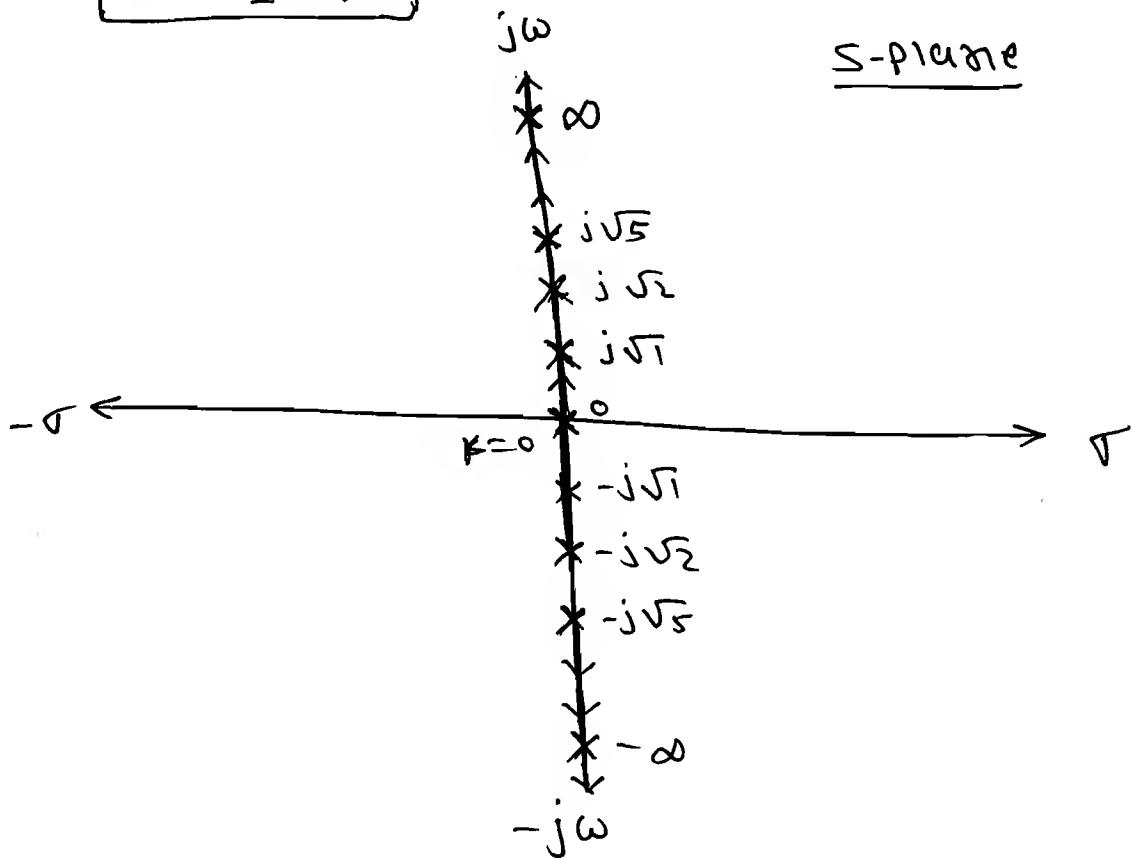

Soln: $C_E \rightarrow 1 + G_K(s) = 0$

$$\therefore 1 + \frac{K}{s^2} = 0.$$

$$\Rightarrow s^2 + k = 0$$

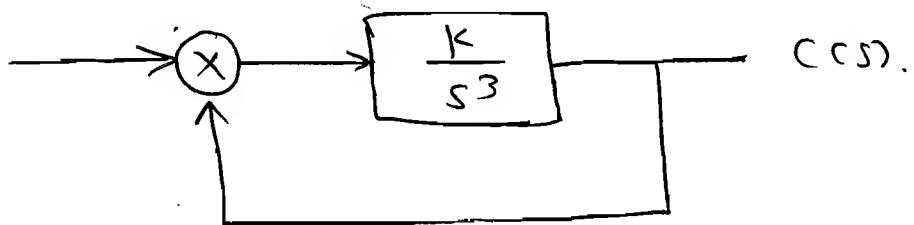

$$s = \pm j\sqrt{k}$$

\Rightarrow

S-plane

a) Draw the Root Locus:

$s^n:$

$$\xrightarrow{\text{CE}} 1 + \frac{K}{s^3} = 0$$

$$s^3 + k = 0.$$

$$s = ?$$

\Rightarrow As order increases finding the roots for the char. eqn is very difficult. Hence we can not draw the Root Locus diagram by using char. eqn.

→ To draw a Root locus diagram we use the open loop transfer function, But the stability analysis is for CL system.

* Relationship between OL transfer fn &

CLTF Poles & zeros:

⇒ i] OLTF:

→ The CL poles are given by char.

$$\text{eqn} \quad 1 + G(s)H(s) = 0.$$

$$\Rightarrow 1 + K \cdot \frac{N(s)}{D(s)} = 0.$$

$$\xrightarrow{\text{CE}} D(s) + K \cdot N(s) = 0.$$

⇒ The CL poles are nothing but the sum of OL poles, OL zeros with the fn of system gain K.

$$\xrightarrow{\text{OLTF}} G(s) \cdot H(s) = K \frac{N(s)}{D(s)} \quad - (1).$$

$$\xrightarrow{\text{OL Poles}} D(s) = 0.$$

$$\xrightarrow{\text{OL Zeros}} N(s) = 0.$$

Case-I: $K=0$, $K = \left| -\frac{D(s)}{N(s)} \right|$

$$D(s) = 0 \leftarrow \text{CL Poles.}$$

\Rightarrow When $K=0$, CL Poles = OL Poles.

\Rightarrow Case - II:

$$N(s) = 0 \longrightarrow K = \pm \infty.$$

When $K=\infty$, CL Poles = OL zeros.

when $K=-\infty$, CL Poles = OL zeros.

\Rightarrow

When $K \uparrow$ $0 \text{ to } \infty$ $\xrightarrow{K=0} X \xrightarrow{\text{OL Poles}} \infty \xrightarrow{K=\infty} 0 \xrightarrow{\text{OL zeros}}$

When $K \uparrow$ $-\infty \text{ to } 0$ $\xrightarrow{K=-\infty} 0 \xrightarrow{\text{OL zeros}} X \xrightarrow{\text{OL poles}} \infty$

\rightarrow From above, we can conclude that when K increases from 0 to ∞ the direction of the root locus branch is from pole to zero because at OL poles K value is ' 0 ' and at OL zeros K value is ' ∞ '.

\Rightarrow If K increases from $-\infty$ to 0 then the direction of Root Locus Branch is from OL zero to OL poles.

because at OL zero, $k = -\infty$ and at
OL Pole $k = 0$.

(a) Identify where the RL branch
Start and ends when k increased
from 0 to ∞ for $G(s) \cdot H(s) = \frac{k(s+1)}{s(s+5)(s+10)}$.

Soln:
$$G(s) \cdot H(s) = \frac{k(s+1)}{s(s+5)(s+10)}$$

[OL Poles] $\Rightarrow s=0, s=-5, s=-10$. ← Start
 $k=0$

[OL zeros] $\Rightarrow s=-1, \underbrace{\infty, \infty}_{\text{angle of Asymptotes}}$. ← end.
 $k=\infty$

**
⇒ * To draw a RL diagram, no. of
Poles is must equal to no. of zeros.
If the zeros are less we assume
zeros are at infinity. The direction of
infinity is given by angle of asymptotes.

**
⇒ * To draw a RL diagram, for one
pole we need one zero, because the
RL branch start at poles and
ends at zeros.

* Angle & Magnitude Conditions:

→ The Construction Rules of Root Locus
are formed by using the angle
Condition such that the Root Locus
diagram gives the CL poles path and
CL system stability.

→ The CL Poles path given by Char. eqⁿ,

(-ve FB)

→ Roots which are formed by (-ve) FB Char. eqⁿ are called direct Root locus (DRL) (or) 180° Rules.

→ Roots which are formed by (+ve) FB Char. eqⁿ are called Inverse Root locus (IRL) (or) Complementary Root locus (CRL) (or) 0° rules.

⇒

DRL

IRL

$R_3 \rightarrow$ odd

even (statement)

$R_4 \rightarrow 22+1$

22 (formula).

Case (iii) $R_6 \rightarrow$ Left most

Right Most (statement)

$R_8 \rightarrow 180^\circ$

0° (formula).

* Purpose of angle cond:

⇒ To check if any point lies on Root Locus (or) not that means all the points on the Root locus must satisfies the angle conditions.

① Verify either the following points lies on the Root Locus or not to the following system,

$$G(s) \cdot H(s) = \frac{K}{s(s+5)(s+10)}$$

i) $s = -3$
ii) $s = -6$

Soln: (i) $s = -3$.

$$\xrightarrow{AC} \angle_{GH}|_{s=-3} = \frac{\angle K}{\angle -3 + 2 \angle 7}$$

$$= \frac{0^\circ}{\pm 180^\circ + 0^\circ + 0^\circ}$$

$$\angle_{GH}|_{s=-3} = \mp 180^\circ$$

Satisfies the odd multiple of 180° .
So, pole is on RL.

(ii) $s = -6$

$$\angle_{GH}|_{s=-6} = \frac{\angle K}{\angle -6 + 1 \angle 4}$$

$$= \frac{0^\circ}{\pm 180^\circ \pm 180^\circ + 0^\circ}$$

$$= \mp 2(180^\circ) \times$$

→ Not satisfies the angle condition
because even no. of 180° .

→ So, given root $s = -6$ do not lies
on RL.

* Magnitude Condition:

⇒

$$\text{M.C.} \rightarrow G(s) \cdot H(s) = -1 + j0.$$

$|G(s) \cdot H(s)|$ at any point which is on RL = 1.

→ If given point is not on RL then M.C. is not valid.

→ So, the angle cond'n must be satisfied to valid the Magnitude Condition (M.C.).

→ Magnitude Condition is valid when the given point is on RL. The given point on the RL is verified by angle condition that means to apply a magnitude condition the A.C. must be satisfied.

: Purpose:

⇒ To find the system gain at any point which is on RL.

a) Find the system gain at a point
 $s = -5 + j5$ to the following system
 i.e. $\frac{K}{s(s+10)}$

Soln:

$$\begin{aligned} \xrightarrow{\text{AC}} |C(s)H(s)| &= \frac{|K|}{|-5+j5 \angle 5+j5|} \\ &= \frac{0^\circ}{135^\circ + 45^\circ} \\ &= -180^\circ \angle \end{aligned}$$

Satisfied the AC.

So, given pole is on RL.

Now, $\xrightarrow{\text{M.C.}}$ $|C_H(s)| = 1$

$$|C_H(s)| = 1$$

$$| \frac{K}{(-5+j5)(5+j5)} | = 1$$

$$| \frac{K}{\sqrt{25+25} \cdot \sqrt{25+25}} | = 1$$

$$K = 50$$

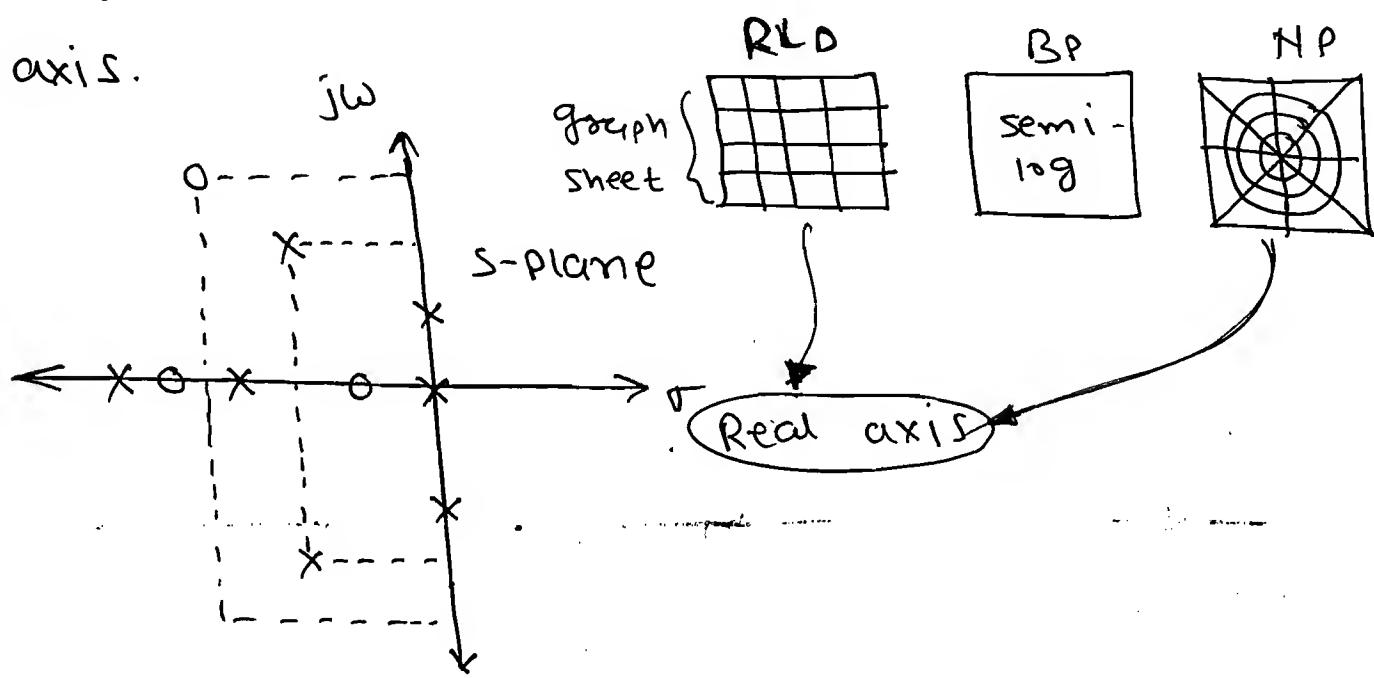

So, System gain at $s = -5 + j5$ is

$$K = 50$$

* Construction Rules for RL:-

Rule - 1 :- Symmetry:

⇒ The root locus diagram is symm. about the real axis because the location of the poles and zeros in the S-plane is symm. about the real axis.

→ The summ. not depends on poles and zeros location . it depends on the graph sheet and on which the plot is constructed the NP (Nyquist Plot) also symm. about the real axis but not Bode plot because the bode plot drawn on non-linear graph sheet (semi-Log).

Rule - 2 :- No. of Loci (or) RL branches.

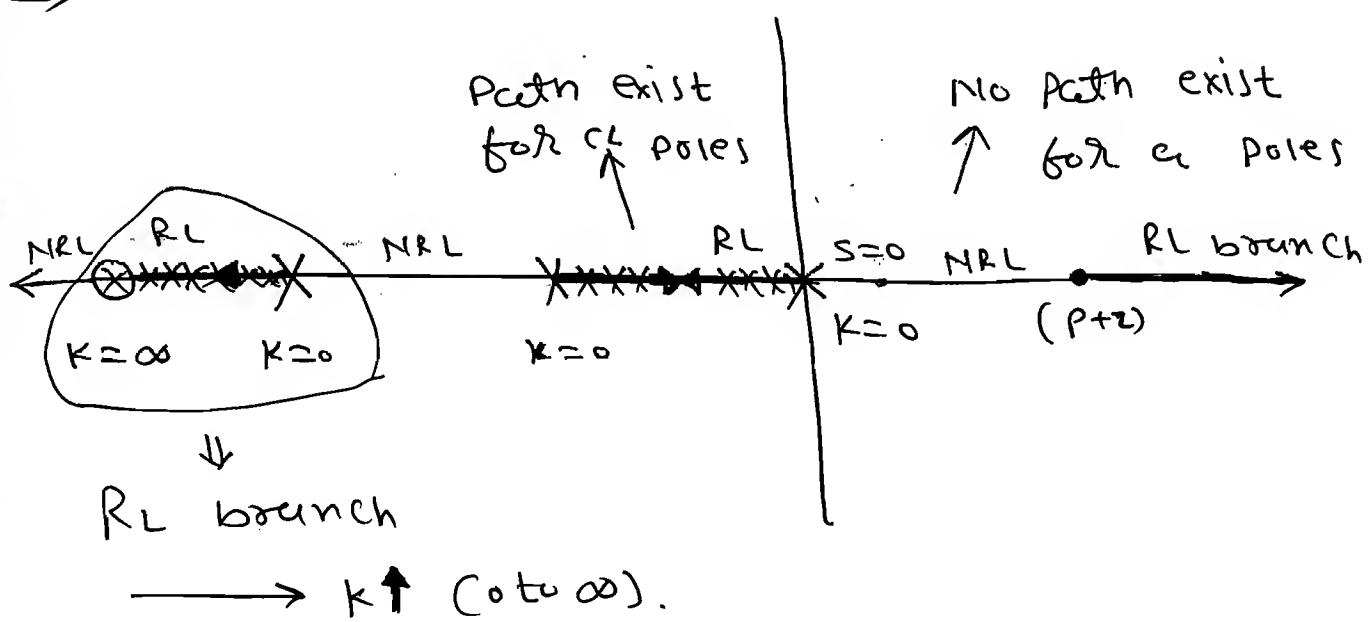

\Rightarrow It depends on no. of poles and zeros.

Case-(i) : Poles > Zeros : No of Loci = No of pole.

Case-(ii) : Zeros > Poles : No of Loci = No. of zeros.
(Poles < zeros)

Rule - 3 :- Recal axis Loci.

\Rightarrow

\Rightarrow A point exist on Real axis such that locus branches, the sum of the the poles and zeros to the Right hand side of that point should be odd.

\Rightarrow The poles moves only on the RL branches. Once the pole reach the

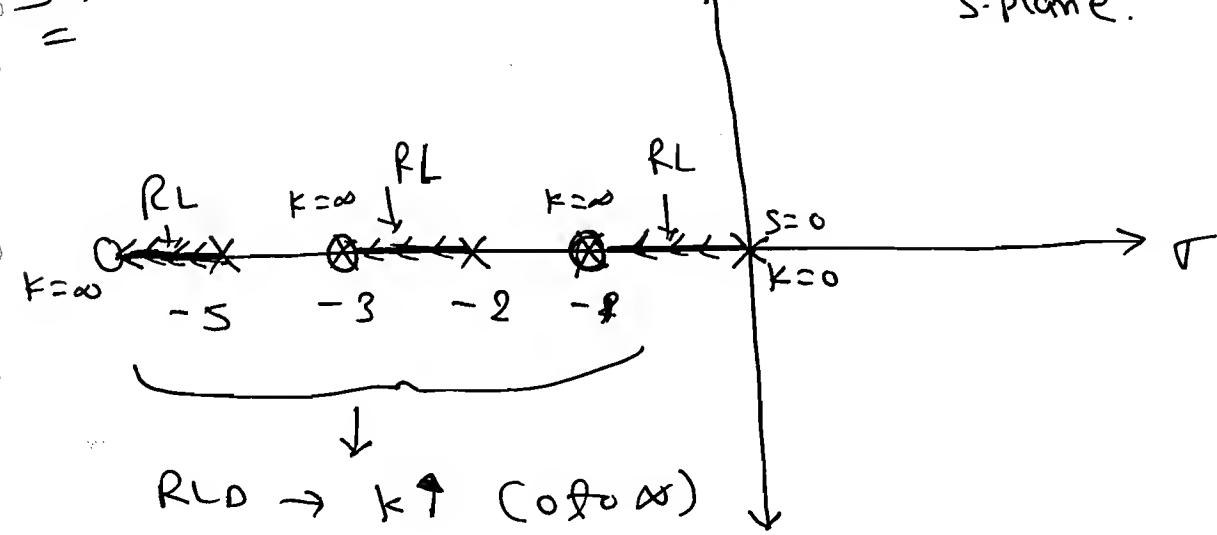

Zero then it become the complete root locus branch for that particular pole where k increased from 0 to ∞ .

\Rightarrow At the position of poles and zeros never apply the angle and magnitude conditions because all the poles and zeros must lies on the RL branches. because that are starting and ending points of RL branches and the k value at pole is zero. and k value at zero ∞ . so never apply magnitude and

Identify the sections of Real axis which belongs to RL.

$$G(s) \cdot H(s) = \frac{k(s+1)(s+3)}{s(s+2)(s+5)}$$

Soln:

(e) Identify the following points which are on RL bounces to the following:

$$G(s) \cdot H(s) = \frac{K(s^2 + 2s + 2)}{s^2(s+2)(s+4)(s+6)}.$$

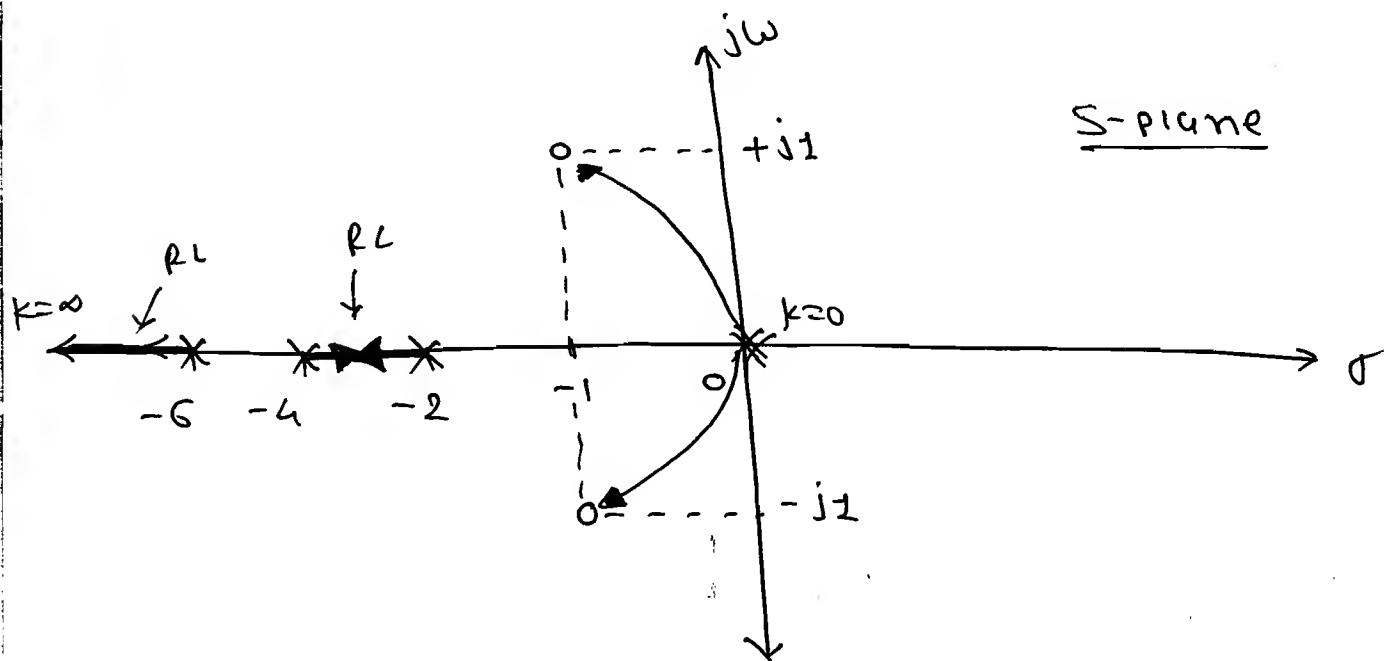

Pole:

$$S=0, \quad S=-2, \quad S=-4, \quad S=-6, \quad S=-1,$$

$$S=-3, \quad S=-5, \quad S=-6, \quad S=-\infty, \quad S=-1+j1 \\ = -1-j1.$$

Sol'n:

$$G(s), H(s) = \frac{k(s+1+j)(s+1-j)}{s^2(s+2)(s+4)(s+6)}.$$

So Vaid.

$$S=0$$

Individual

$$S = -2$$

$$S = -S$$

$$S = -g$$

$$S = -1$$

S = -6

$$s = -1 + j$$

$$S^2 = \{ -j \}$$

— 3 —

$$S = -\infty$$

Rule - 4: Asymptotes :

⇒ Asymptotes are the RL branches which are approach to the infinity.

⇒ No. of Asymptotes $N = P - Z$.

$$\text{Angle of Asymptotes } \theta = \frac{(2q+1)180^\circ}{(P-Z)},$$

$$q = 0, 1, 2, \dots, (P-Z-1).$$

Note: The Asymptotes gives the directions of zeros, when no. of poles are greater than zeros.

Rule - 5 :- Centroid

⇒ The centroid is nothing but intersection point of asymptotes on the real axis.

$$\Rightarrow (\text{Centroid}) = \frac{\sum \text{Real part of Poles} - \sum \text{Real part of Zeros}}{(P-Z)}$$

⇒ The centroid may be located anywhere on the real axis. It may (or) may not be on RL branch.

(e) Find the angle of Asymptotes and
Centroid $G(s) - H(s) = \frac{k}{s(s+5)(s+10)}$.

$S_0^n:$

$$P=3, Z=0.$$

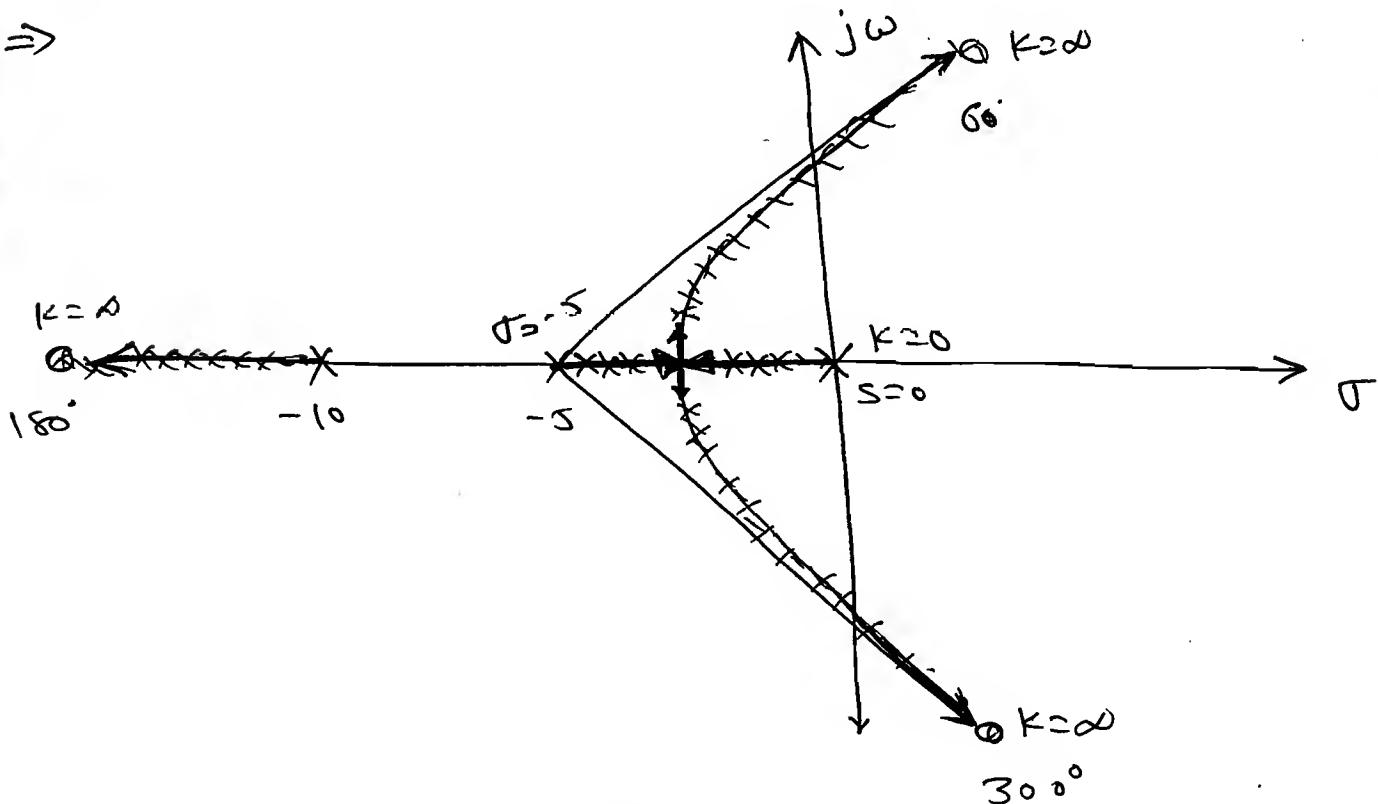

$$\text{Centroid } (\sigma) = \frac{(-0 - 5 - 10) - (0)}{3-0} \\ = -15/3 \\ \boxed{\sigma = -5}$$

$$\therefore \theta = \frac{(2q+1) 180^\circ}{P-Z}$$

$$\therefore \theta = \frac{(2q+1) 180^\circ}{Z} 60^\circ$$

$$\theta = 60^\circ, 180^\circ, 300^\circ.$$

\Rightarrow

$$\Rightarrow \text{At Collision } +\frac{180^\circ}{n} = \pm \frac{180^\circ}{2} = \pm 90^\circ.$$

\Rightarrow The centroid is mainly required to draw the angle of asymptotes.

$$(c) G(s) \cdot H(s) = \frac{k(s+10)}{s^2(s+1)}$$

Som:

$$\text{angle } \theta = \frac{(2r+1)180^\circ}{p-2}$$

$$= \frac{(2r+1)180^\circ}{3-1}$$

$$= \frac{180^\circ}{2} \text{ go } (2r+1)$$

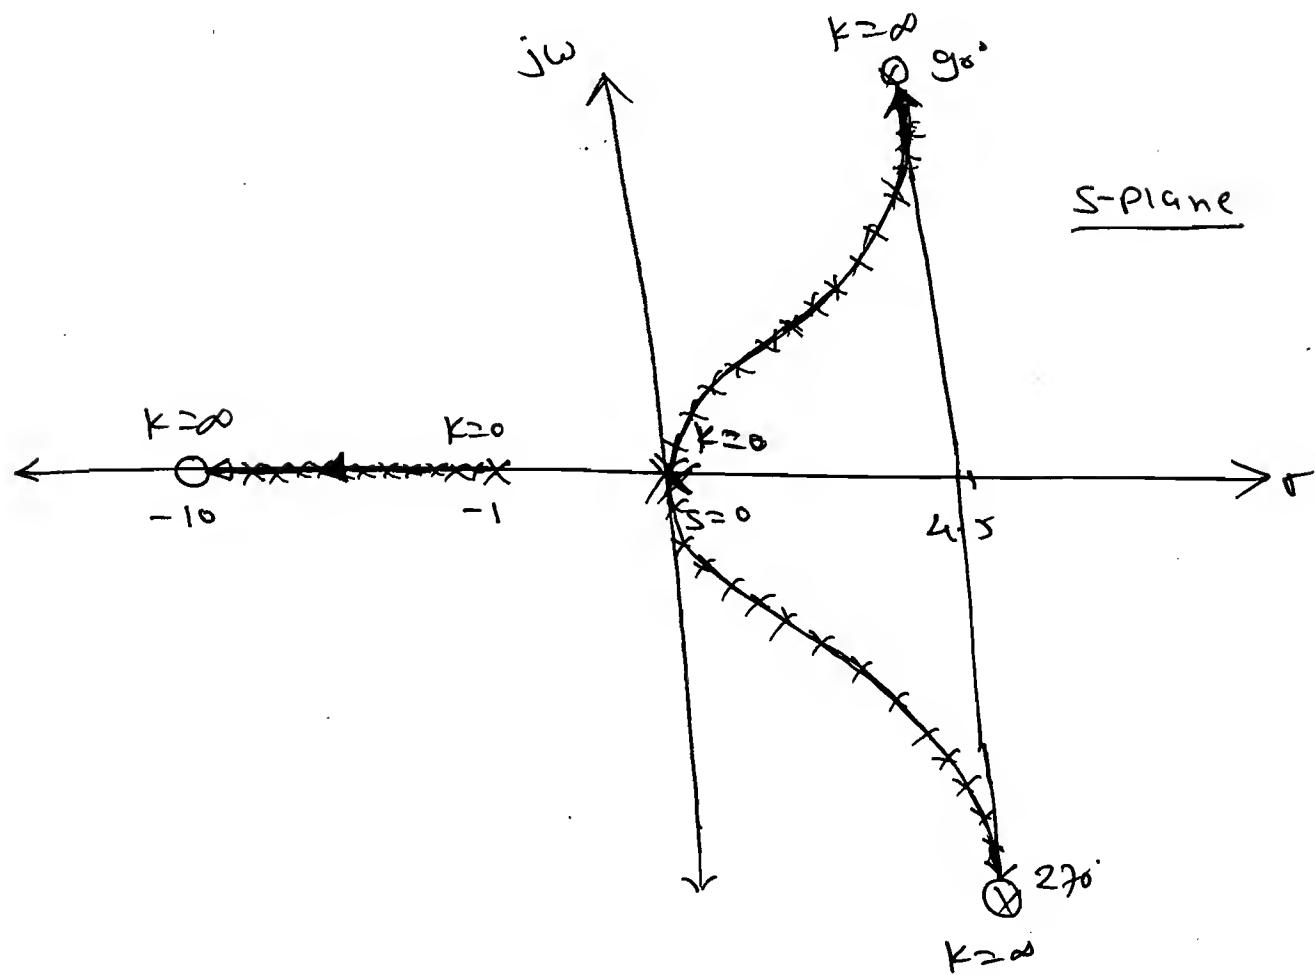

$$\theta = 90^\circ, 270^\circ$$

$$\text{Centroid} = \frac{(-0-0-1) - (-10)}{3-1}$$

$$= \frac{-1+10}{2}$$

$$\boxed{\sigma = 4.5}$$

=)

Rule - 6 :- Break Point [Junction of 2 (or) more poles].

⇒ The point at which two (or) more poles meet (or) two or more poles directly located at any point then it is called Break point.

⇒ Breakaway Point :-

→ The point at which the Root Locus branches leaves the real axis is called breakaway point.

⇒ Breakin Point :-

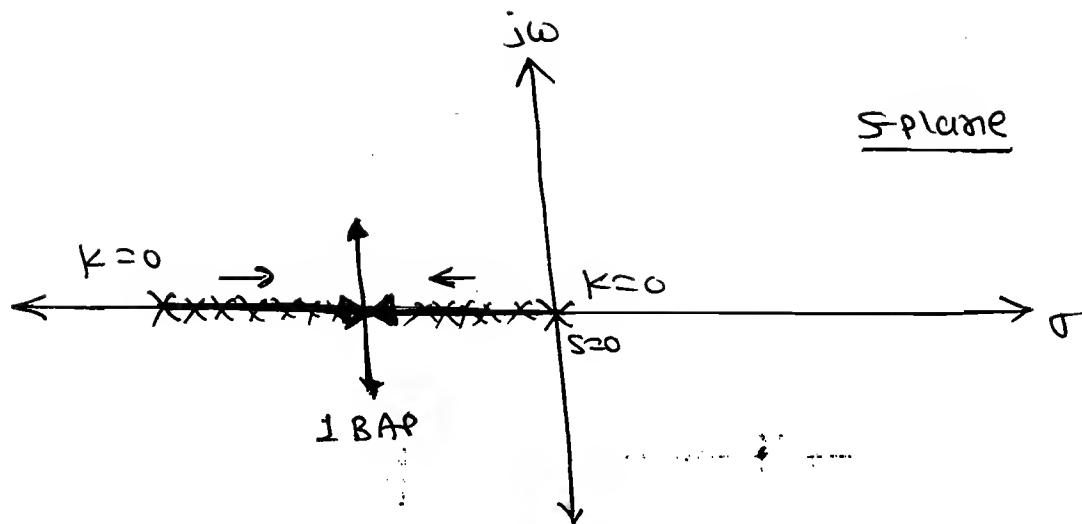

→ The point at which RL branches enters into the point on Real axis is called Breakin point.

* Finding the existence of the Break Points:

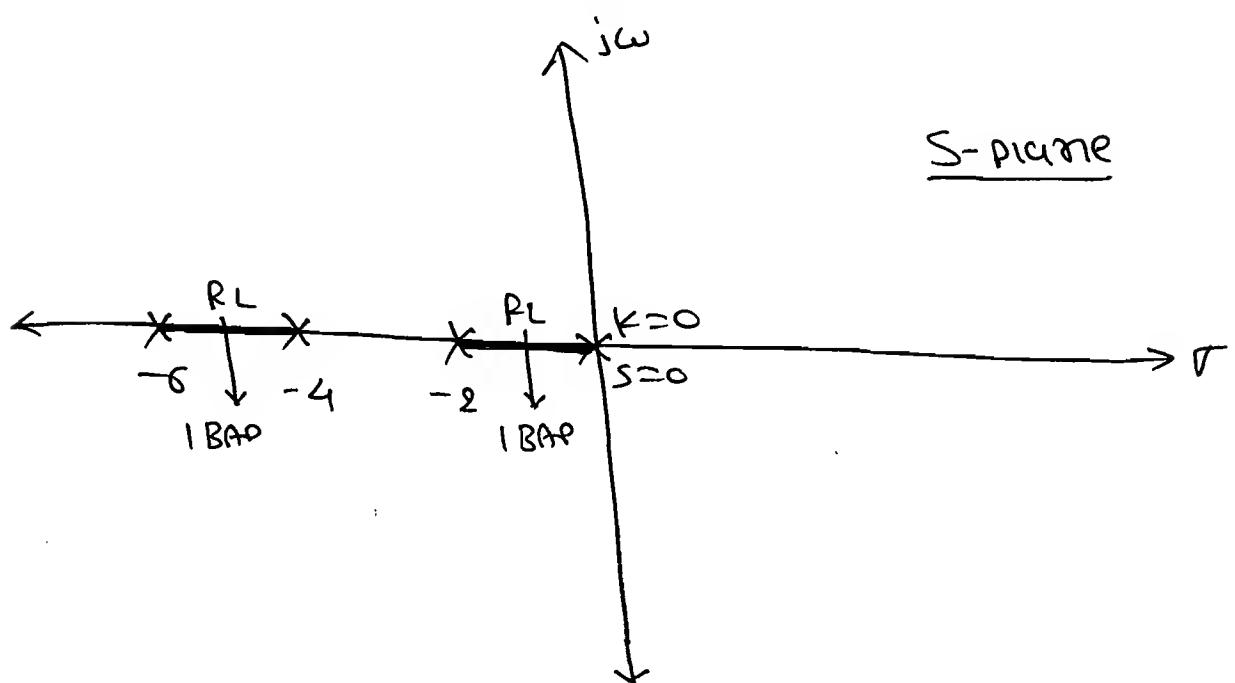

case - I:

⇒ Whenever there are two adjacently placed poles in between there exist a RL branch, then there should be the minimum one break away point (BAP) in between adjacently placed poles.

\Rightarrow

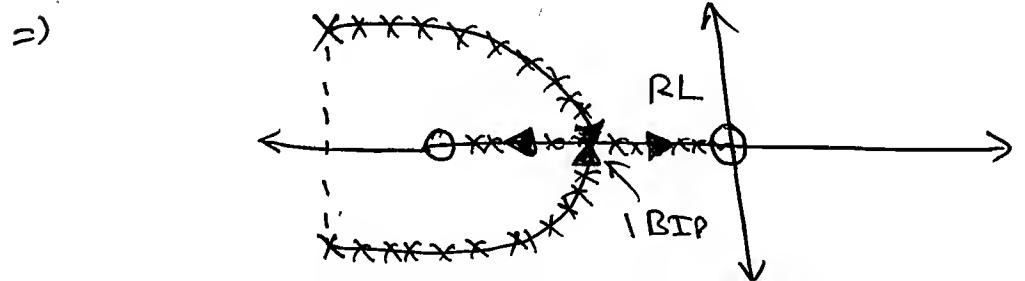

e.g. $G(s) = \frac{K}{s(s+2)(s+4)(s+6)}$.

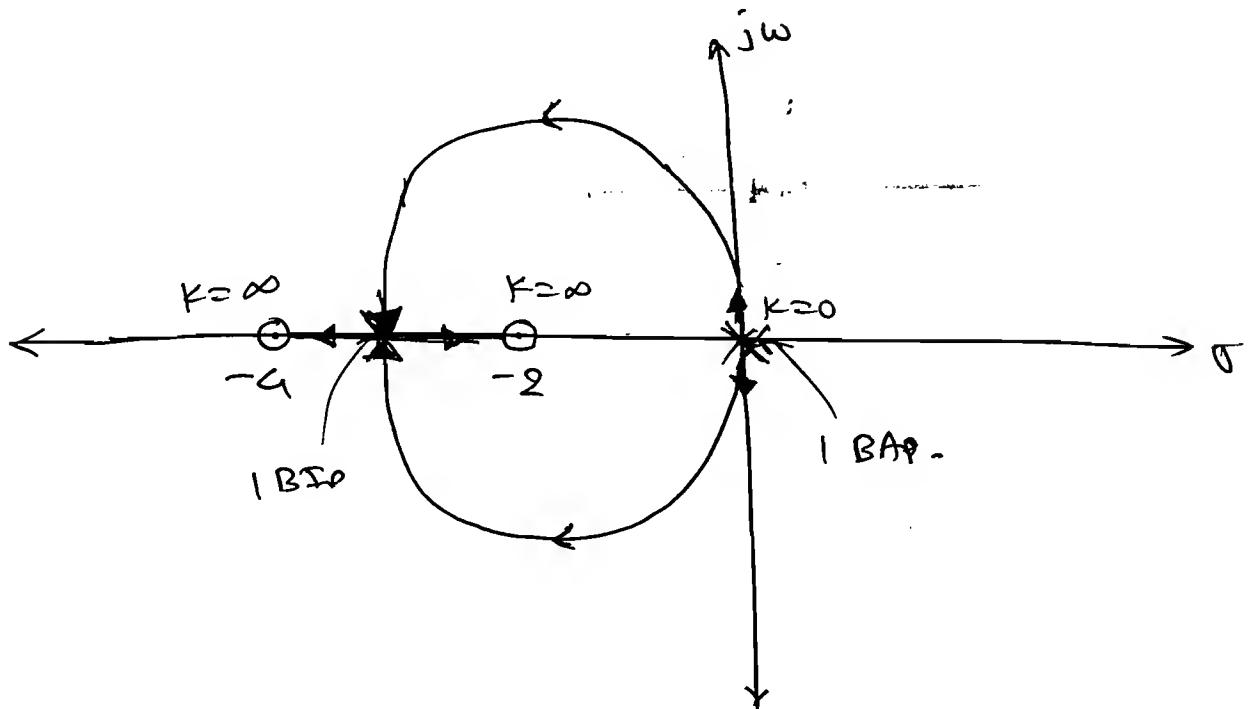

Case-II :-

\Rightarrow Whenever there exist a two adjacently placed zero in betⁿ there exist a RL branch then there should be the minimum one break in point in betⁿ adjacently placed zero.

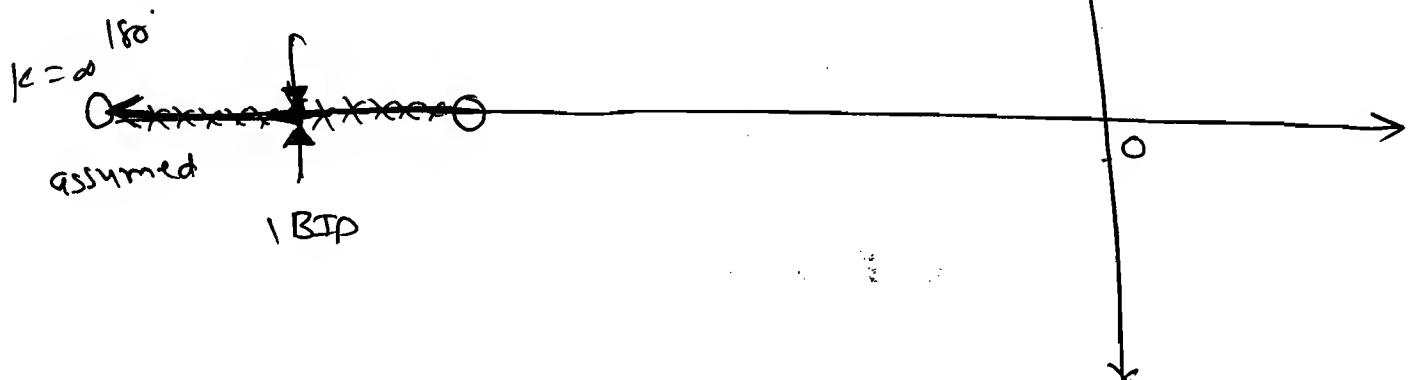

E.g. $G(s) H(s) = \frac{K(s+2)(s+4)}{s^2}$

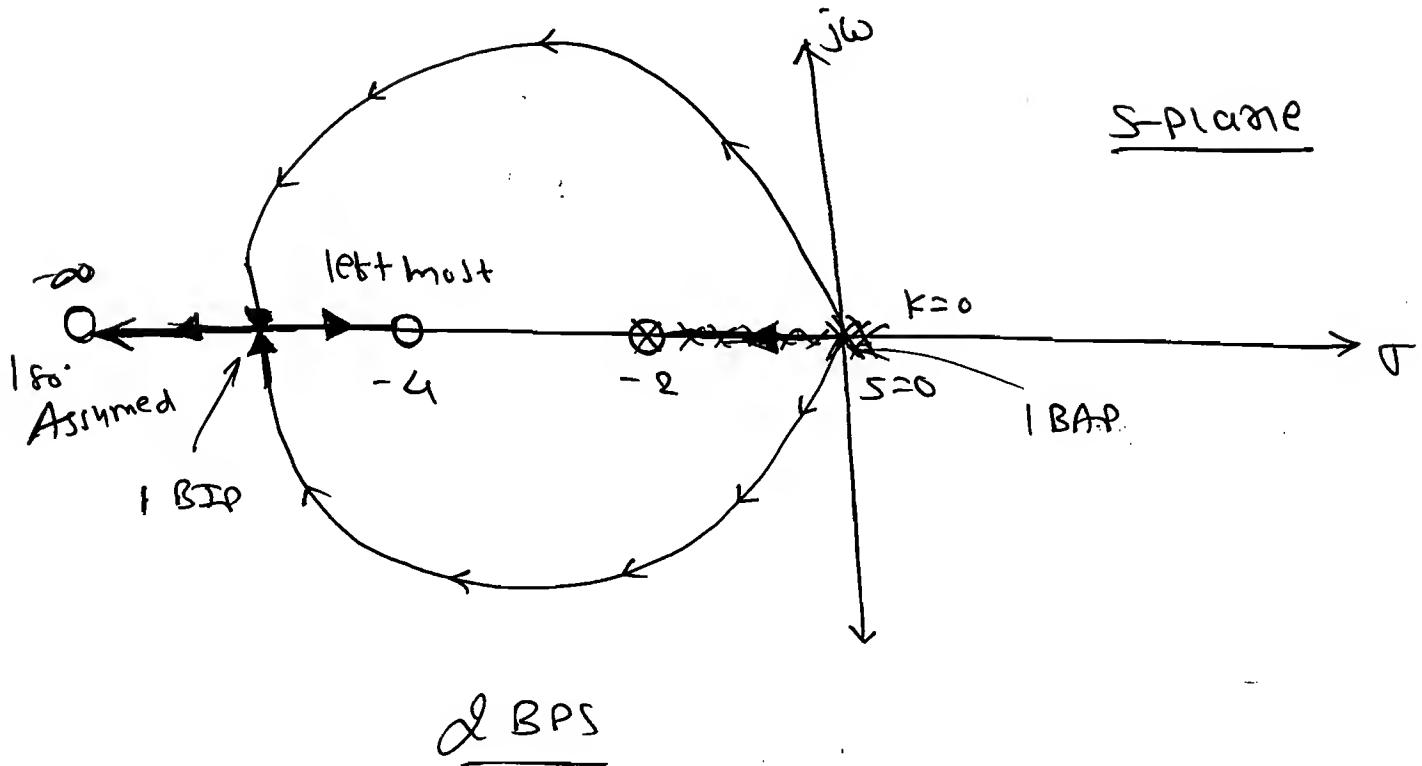

Case - III:- P > Z

⇒ Whenever there exist left most side zero to the left most side of that zero there exist a RL branch then there should be the minimum one breaking point to the left most side of the zero when no. of Poles are greater than no. of zeros.

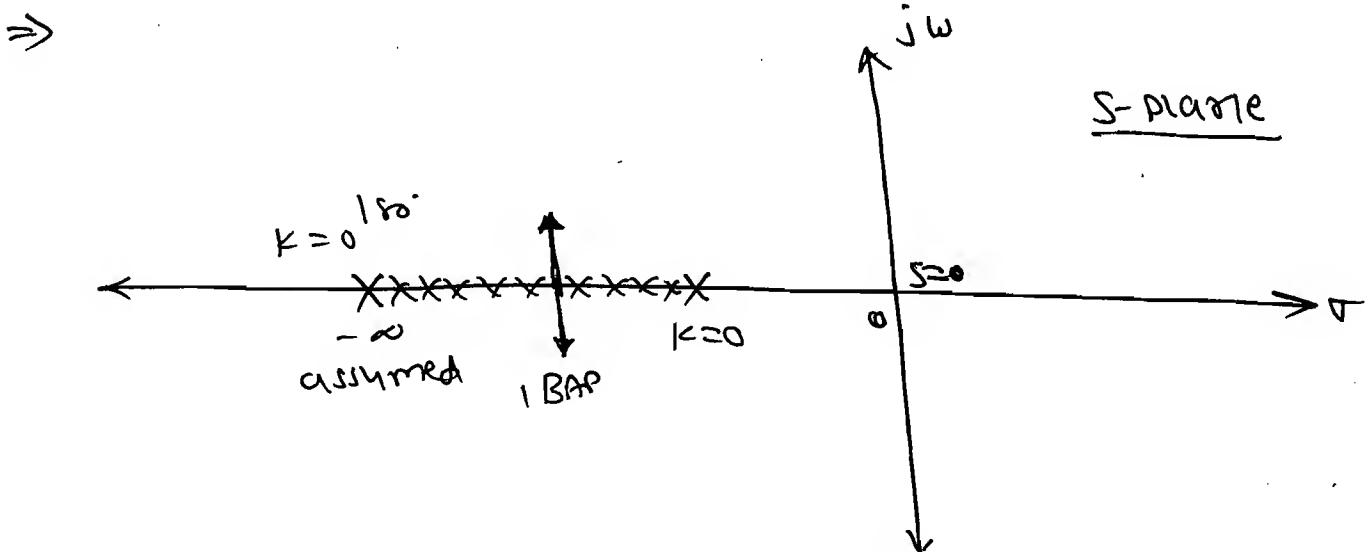

⇒

$$\text{e.g. } G(s) \cdot H(s) = \frac{k(s+2)(s+4)}{s^3}$$

Case- IV: $P < 2$

\Rightarrow Whenever there exist a left most side pole to the left most side of that pole there exist a RL branch then there should be a minimum one breakaway point to the left most side of the poles less than zero. when the no. of zeros only.

⇒ This case is practically not exist because the control systems are LPF that means the no. of poles must be greater than zeros only.

* Finding the location of Break points:

Step - 1: Form the Char. equation.

Step - 2: Rewrite the above eqn in the form of $K = F(s)$.

Step - 3: Differentiate K with respect to s and make equal to 0. The roots of $\frac{dK}{ds} = 0$ gives the valid and invalid Breakpoint.

→ The valid BP is the one which must be on RL branch (∞), for valid B.P. K value in step 2 should be (+ve).

a) Find the location of BP.

$$\textcircled{1} \quad CM = \frac{K}{s(s+2)}$$

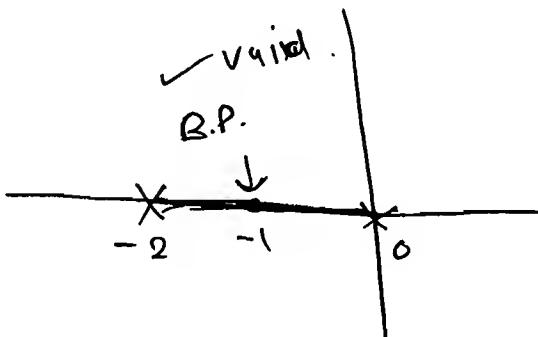

Sum:

$$\xrightarrow{\text{CE}} 1 + \alpha h = 0$$

$$1 + \frac{K}{s(s+2)} = 0$$

$$\Rightarrow K = -s^2 - 2s$$

$$\frac{dK}{ds} = -2s - 2 = 0 \Rightarrow s = -1$$

$$\textcircled{Q} \quad \textcircled{2} \quad G_H = \frac{K}{S(S+2)(S+4)}.$$

\therefore Soln,

$$1 + G_H = 0$$

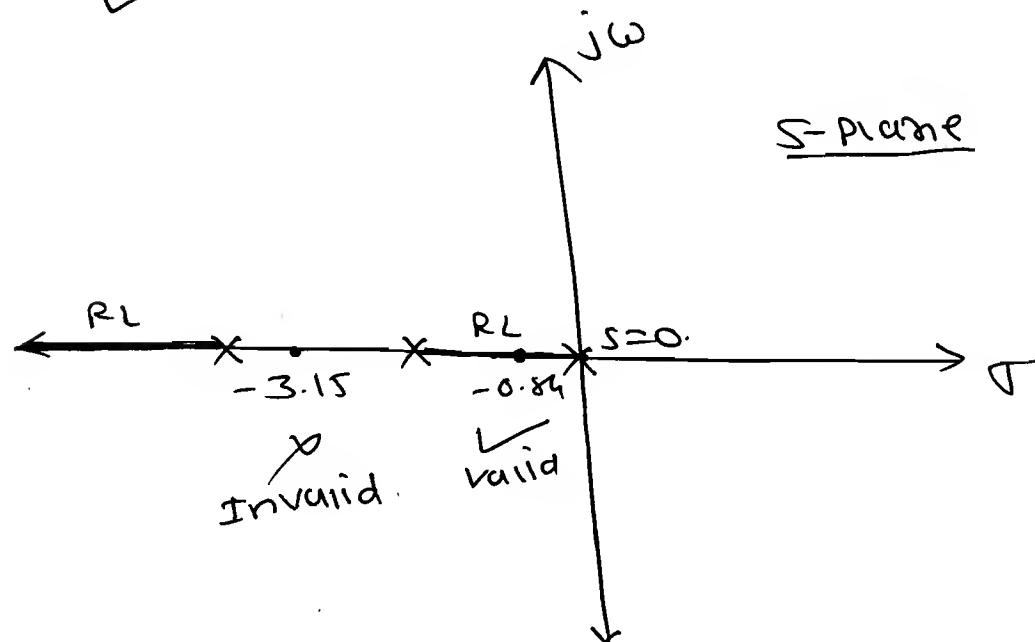

$$\therefore 1 + \frac{K}{S(S+2)(S+4)} = 0.$$

$$K = -S^3 - 6S^2 - 8S.$$

$$\therefore \frac{dK}{dS} = -3S^2 - 12S - 8 = 0.$$

$$\boxed{S = -0.84}, \quad \boxed{S = -3.15} \quad \times$$

\Rightarrow

$$\textcircled{3} \quad G_H = \frac{K(S+4)}{S(S+2)}.$$

\therefore Soln,

$$1 + G_H = 0.$$

$$1 + \frac{K(S+4)}{S(S+2)} = 0.$$

$$\therefore K = -\left[\frac{S^2 + 2S}{S+4} \right].$$

$$\therefore \frac{dK}{dS} = -\left[\frac{(S+4)(2S+2) - (S^2 + 2S)(1)}{(S+4)^2} \right] = 0.$$

$$\Rightarrow -2s^2 - 8s - 2s - 8 + s^2 + 2s = 0.$$

$$\therefore s^2 + 8s + 8 = 0.$$

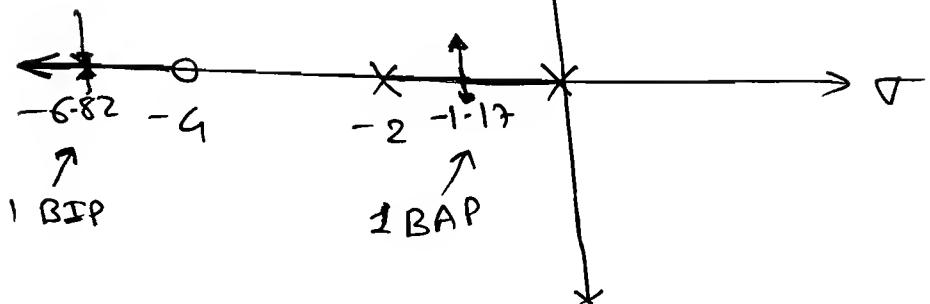

$$s = -1.17, -6.82.$$

BAP

\uparrow BIP.

$j\omega$

\Rightarrow

Rule - 7 : Intersection point with Imaginary axis:

\Rightarrow The intersection point with Imaginary axis is obtained by RH criterion.

- (i) Form the Char. equation.
- (ii) Write the Routh - tabular form.
- (iii) Find the K marginal value.
- (iv) Form the Auxiliary equation. The roots of auxiliary equation gives the valid or invalid intersection point with imaginary.

\Rightarrow For valid intersection point with imaginary the K marginal be +ve.

Find the intersection point with imaginary axis $G(s) \cdot H(s) = \frac{K}{s(s+2)(s+4)}$.

SOLN:

$$\xrightarrow{\text{CE}} 1 + G_H(s) = 0$$

$$1 + \frac{K}{s(s^2 + 6s + 8)} = 0.$$

$$\Rightarrow s^3 + 6s^2 + 8s + K = 0.$$

$$\begin{array}{c|cc} s^3 & 1 & 8 \\ s^2 & 6 & K \\ s^1 & \frac{48-K}{6} & \\ s^0 & K & \end{array}$$

for M.R. ,

$$\begin{aligned} 48 - K &= 0 \\ \Rightarrow K_{\text{max}} &= 48. \end{aligned}$$

$$\therefore \xrightarrow{\text{AE}} 6s^2 + K_{\text{max}} = 0$$

$$6s^2 + 48 = 0$$

$$s^2 = -8$$

$$s = \pm j\sqrt{8}.$$

Rule-8 :- Angle of Departure / Arrival :-

\Rightarrow The angle of departure calculated at a complex conjugate pole and angle of arrival calculated at a complex conjugate zero.

\Rightarrow Angle of Departure:-

\Rightarrow It gives that with what angle the pole depart or leaves from the initial position given by angle of departure.

$$\rightarrow \phi_d = 180 + |\angle_{GH}| \text{ at a (+ve) imag. Complex pole.}$$

$$\rightarrow \phi_d = 180 - \phi \text{ where, } \phi = \sum \phi_p - \sum \phi_z.$$

\Rightarrow Angle of Arrival:-

\Rightarrow It gives that with what angle the poles arrives, terminates at the Complex zero given by angle of arrival.

$$\rightarrow \phi_a = 180 - |\angle_{GH}| \text{ at a (+ve) img. Complex zero.}$$

$$\rightarrow \phi_a = 180 + \phi \text{ where, } \phi = \sum \phi_p - \sum \phi_z.$$

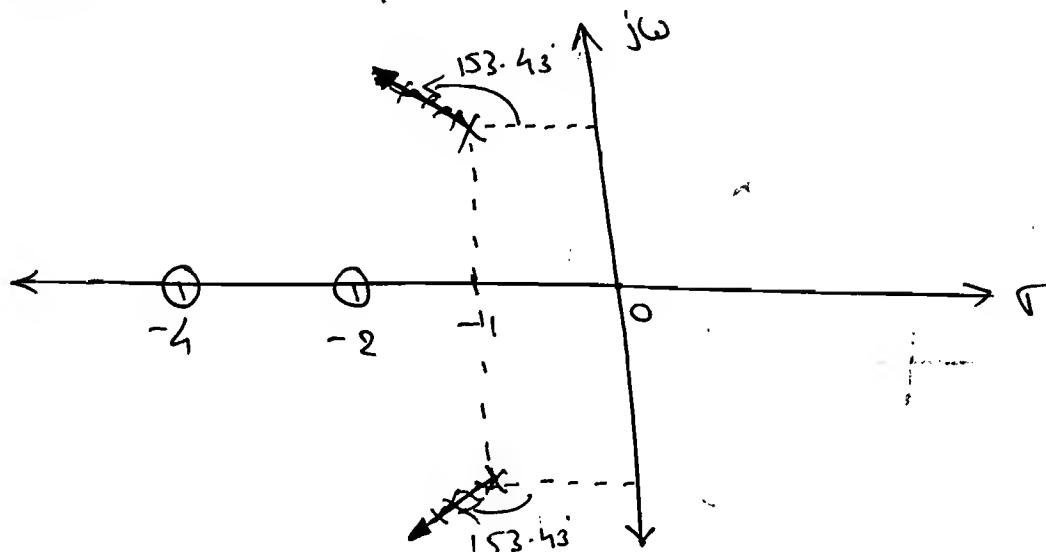

(c) Calculate the angle of departure at a complex pole

$$G(s) \cdot H(s) = \frac{K(s+2)(s+4)}{s^2 + 2s + 2}$$

Soln:

Poles: $s = -1 \pm j1$.

Zeros: $s = -2, -4$.

$$\begin{aligned} \angle_{GH} \Big|_{s=-1+j1} &= \frac{\angle K \cdot \angle 1+j1 \cdot \angle 3+j1}{\angle 0 \cdot \angle j2} \\ &= \frac{0^\circ + 45^\circ + 18.43^\circ}{0^\circ + 90^\circ} \end{aligned}$$

$$\angle_{GH} = -26.27^\circ$$

$$\therefore \phi_d = 180^\circ + \angle_{GH} = 180^\circ + (-26.27^\circ)$$

$$\boxed{\phi_d = 153.43^\circ}$$

(c) Calculate Angle umge $G(s) \cdot H(s) = \frac{K(s^2 + 2s + 2)}{(s+2)(s+4)}$

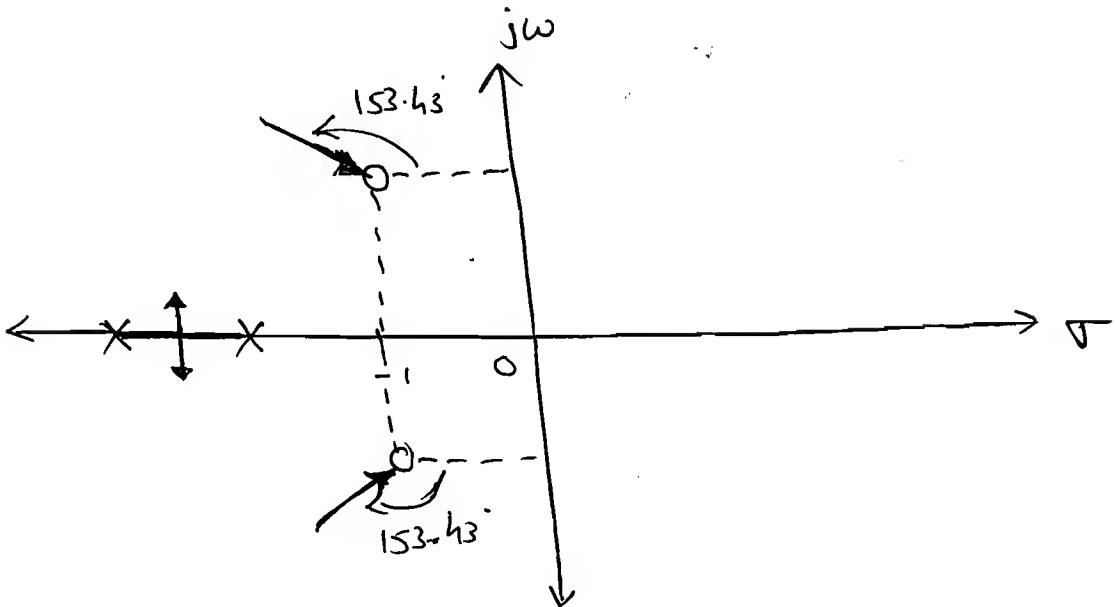

Soln:

$$\begin{aligned} \angle_{GH} \Big|_{s=-1+j} &= \frac{\angle K \angle 0 \angle 2j}{\angle 1+j \cdot \angle 3+j} \\ &= \frac{0 + 0 + 90^\circ}{45^\circ + 18.43^\circ} \end{aligned}$$

$$\angle \text{crH} = +26.27^\circ$$

$$\begin{aligned}\phi_a &= 180^\circ \pm \angle \text{crH.} \\ &= 180^\circ - 26.27^\circ\end{aligned}$$

$$\boxed{\phi_a = 153.43^\circ}$$

Note:

- Whenever all the zeros and poles are interchanged the angle of departure equal to angle of arrival. the breakaway point is equal to Breakaway point.
- The shape of the RL diagram is also same except the direction.

* Procedure:

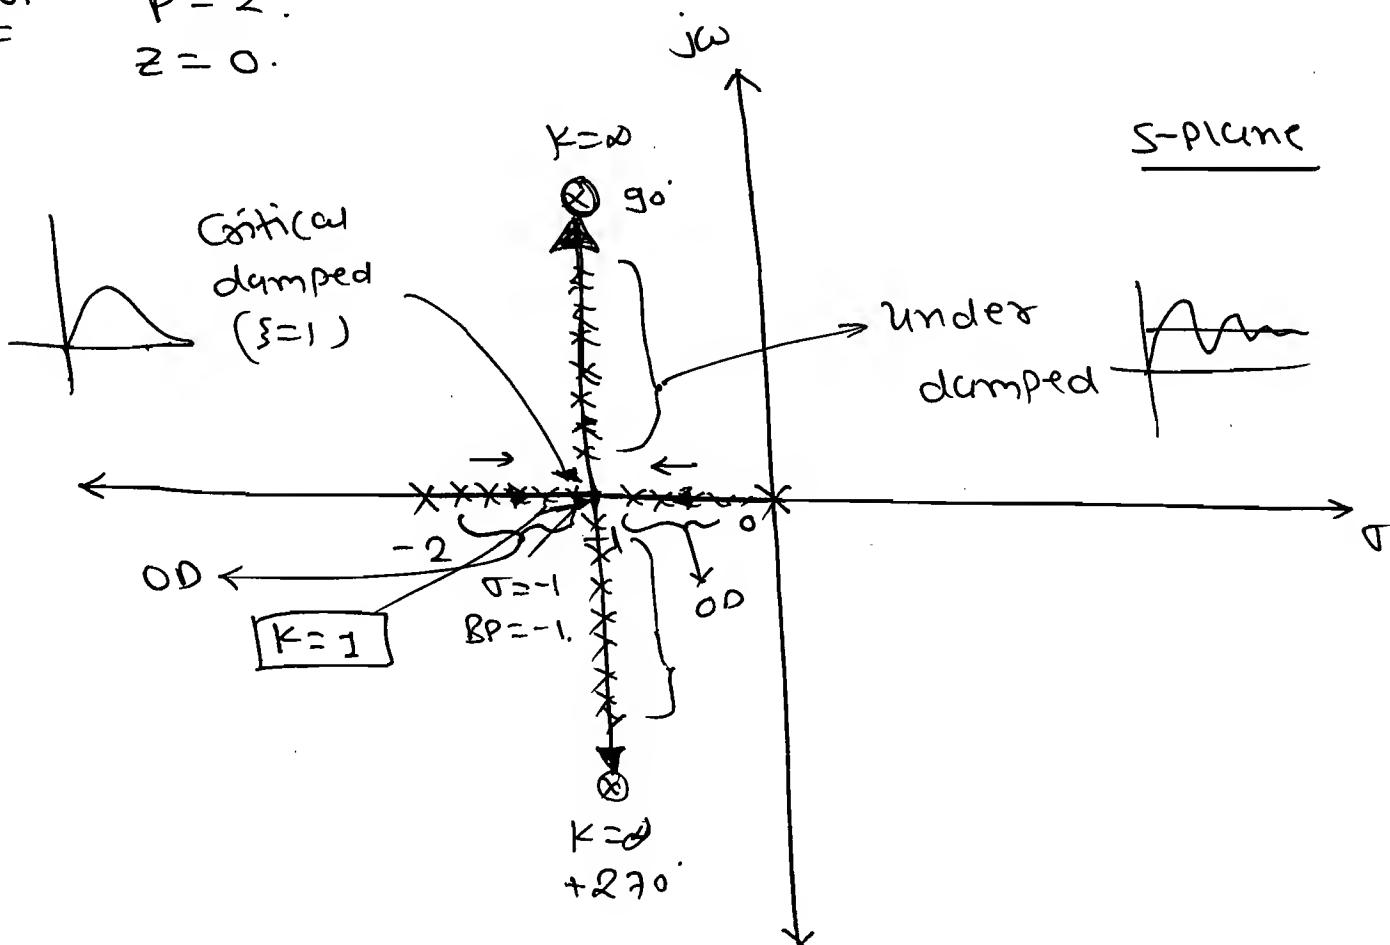

- ① Identify the RL branches and B.P.
- ② Find the centroid and angle of Asymptotes. (If required).
- ③ Find angle of departure and arrival.

(iv) Vary the R value from 0 to ∞ to identify the path form pole to zero such that the Root locus locus diagram pole must reaches the zero.

Q. Draw the RL diagram to the following Systems and find the CL System Stability.

$$\textcircled{1} \quad G(s) \cdot H(s) = \frac{K}{s(s+2)}$$

$$\text{Soln: } P = 2, \quad Z = 0.$$

$$\Rightarrow \text{Centroid } \sigma = \frac{(\sigma_1 + \sigma_2) - (\text{co})}{2 - 0}$$

$$\boxed{\sigma = -1}$$

$$\Rightarrow \underline{A \cdot A} \cdot \theta = \frac{(2\alpha+1)}{\rho-2} \times 180^\circ$$

$$= \frac{(2\alpha+1)}{2} \times 180^\circ$$

$$\theta = 90^\circ, 270^\circ$$

$$\Rightarrow \underline{B.P.} \rightarrow s^2 + 2s = 0$$

$$2s + 2 = 0$$

$$\boxed{s = -1}$$

\Rightarrow The above system having over damped, critical damped and under damped nature but not undamped. To set the K values for different nature of the systems we required to find K value at the BP.

Method - I:

$$\underline{M.C.} \rightarrow \left| \frac{K}{s(s+2)} \right|_{s=-1} = 1$$

$$\Rightarrow \left| \frac{K}{(-1)(1)} \right| = 1$$

$$\Rightarrow \boxed{K = 1}$$

Method - II:

$K = \frac{\text{Product of lengths from the pt to poles}}{\text{Product of lengths from the pt to zeros}}$

$$= \frac{C(s) H(s)}{N(s) Z(s)}$$

$$K = 1$$

$\Rightarrow 0 < K < 1 \rightarrow O.D.$

$K = 1 \rightarrow C.D.$

$K > 1 \rightarrow \text{underdamped.}$

\Rightarrow The Root Locus diagram gives the CL poles path. But not the OL poles path.

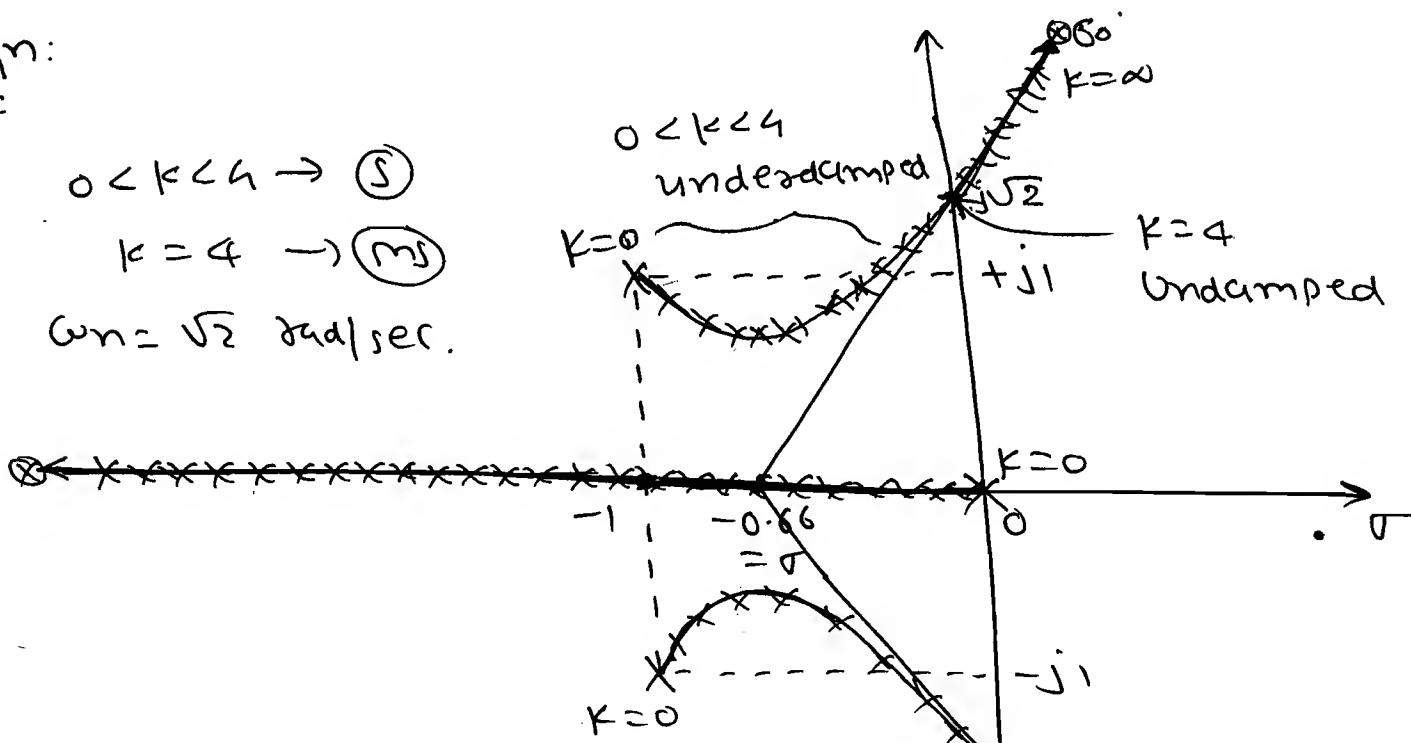

$$(2) G(s) \cdot H(s) = \frac{K}{s(s^2 + 2s + 2)}$$

Soln:

$0 < K < 4 \rightarrow \text{S}$

$K = 4 \rightarrow M$

$\omega_n = \sqrt{2} \text{ rad/sec.}$

$$\Rightarrow 1 + G(s) \cdot H(s) = 1 + \frac{K}{s(s^2 + 2s + 2)} = 0$$

$$= s^3 + 2s^2 + 2s + K = 0.$$

$$\Rightarrow \text{Centroid } \sigma = + \frac{(-1-1) - 0}{P-2}$$

$$= -\frac{2}{3}$$

$\sigma = -0.66$

$$\rightarrow \text{BP} \quad s^3 + 2s^2 + 2s = 0$$

$$3s^2 + 4s + 2 = 0.$$

$$s = -\frac{2}{3} + j\frac{2}{3}, -\frac{2}{3} - j\frac{2}{3} + X \text{ (Not valid)}$$

$$\rightarrow \text{A.A.} \quad \theta = \frac{(2q+1)180^\circ}{P-2}$$

$$= \frac{(2q+1)180^\circ}{3}$$

$$\theta = 60^\circ, 180^\circ, 300^\circ.$$

$$\rightarrow \text{I.P.} \quad \underbrace{s^3 + 2s^2 + 2s}_K + K = 0$$

$K = 4$

$$\xrightarrow{\text{AE}} ds^2 + \frac{K}{ds} = 0$$

$$4/8 + 1/2 \geq 0$$

$$\alpha s^2 = -4$$

$s = \pm j\sqrt{2}.$

$$\therefore j\omega_n = \pm j\sqrt{2}$$

$\omega_n = \sqrt{2} \text{ rad/sec}$

\Rightarrow Angle of Departure:

$$\angle \text{Cm} = \frac{\angle K}{\angle q + j \angle 2j} = \frac{0}{135^\circ + 90^\circ} = -225^\circ$$

$$\phi_d = 180^\circ + \angle \alpha_H$$

$$= 180^\circ - 225^\circ$$

$$\phi_d = -45^\circ$$

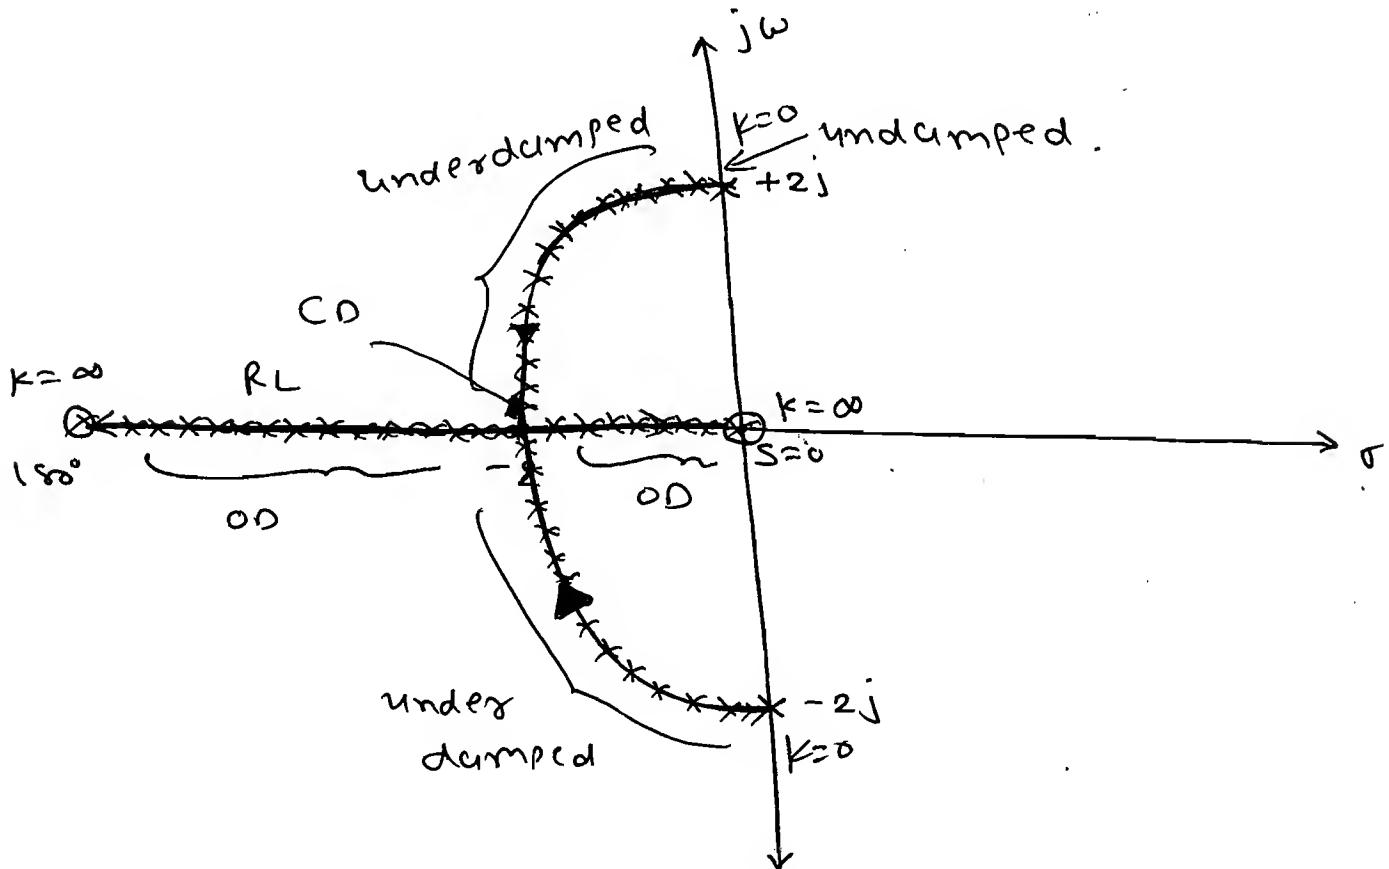

(e) $G_H = \frac{KS}{S^2 + 4}$

Soln: $P = 2, Z = 1.$

$$P - Z = N = 1.$$

$$\xrightarrow{A \cdot A} \frac{(2Z+1)180^\circ}{P-Z} = \frac{(2Z+1)180^\circ}{1} = 180^\circ$$

Note: The centroid is required when the no. of asymptotes are more than 1.

$$\xrightarrow{BP} 1 + \alpha_H = 0.$$

$$1 + \frac{KS}{S^2 + 4} = 0 \Rightarrow \frac{dK}{ds} = - \left[\frac{S(2s) - s^2 - 4}{s^2} \right] = 0.$$

$$K = - \left[\frac{s^2 + 4}{s} \right]$$

$$\Rightarrow 2s^2 - s^2 = 4 \quad \checkmark \\ s^2 = 4 \\ \Rightarrow S = -2, S = +2$$

$$\left|G_H\right|_{s=2j} = \frac{\angle k \angle^{2j}}{\angle 0 \angle^{4j}} = 0$$

$$\phi_a = 180^\circ + \angle G_H = 180^\circ$$

$\Rightarrow \xrightarrow{\text{M.R.}}$

$$\left|G_H\right|_{s=-2} = 1.$$

$$\therefore \left| \frac{k(-2)}{4+4} \right| = 1.$$

$k = 9$

$\Rightarrow k=0 \rightarrow \text{undamped.}$

$0 < k < 4 \rightarrow \text{underdamped.}$

$k = 4 \rightarrow \text{critical damped.}$

$\infty > k > 4 \rightarrow \text{OD.}$

a) $G_H(s) = \frac{k}{s^4 - 1}$

Soln: Poles: $s^4 - 1 = 0$
 $(s^2 - 1)(s^2 + 1) = 0$
 $\Rightarrow s = \pm 1, \pm j.$

$\Rightarrow P-2 = 4 - 0 = 4 = N.$

A.A. $\theta = \frac{(2a+1)}{k} \times 180^\circ$

$$\theta = 45^\circ, 85^\circ, 135^\circ, 225^\circ, 315^\circ$$

$$= -243.43^\circ.$$

$$\therefore \phi_d = 180 + \angle \alpha_H$$

$$\boxed{\phi_d = -63.435^\circ}$$

* Effect of Addition of Poles and zeros:

⇒ The addition of poles and zeros only in the left of S-plane.

① Addition of Poles:

⇒ The root locus branches shifted towards the right of S-plane.

⇒ The relative stability of system decreases.

⇒ The range of K value for system stability decreases.

⇒ The system becomes more oscillatory.

⇒ The addition of poles decreases the BW (higher cut off freq. decreases).

⇒ As BW decreases, the rise time increases ~~increases~~ and the system becomes has slow response.

⇒ The noise is eliminated.

⇒ The system gives the more accurate OIP.

⇒ As the root locus moving towards the right side time constant increases and settling time also increases.

\Rightarrow The damping ratio decreases.

\Rightarrow As ζ decreases, $-1/M_p$ increases.

② Addition of zeros:

\Rightarrow The root locus branches shifted towards the left side.

\Rightarrow The system becomes more relative stable.

\Rightarrow The range K value for system stability increases.

\Rightarrow The system becomes less oscillatory.

\Rightarrow If BW of the system increases (higher cut off freq. increases).

\Rightarrow As BW increases, rise time decreases. The system gives the quick response. The noise signal enters into the system (less accurate).

\Rightarrow As the root locus branches shifted toward left side, the time constant decreases and settling time also decreases.

\Rightarrow The damping ratio ζ increases, $-1/M_p$ decreases. The system becomes more relative stable.

\Rightarrow The addition of pole makes the system

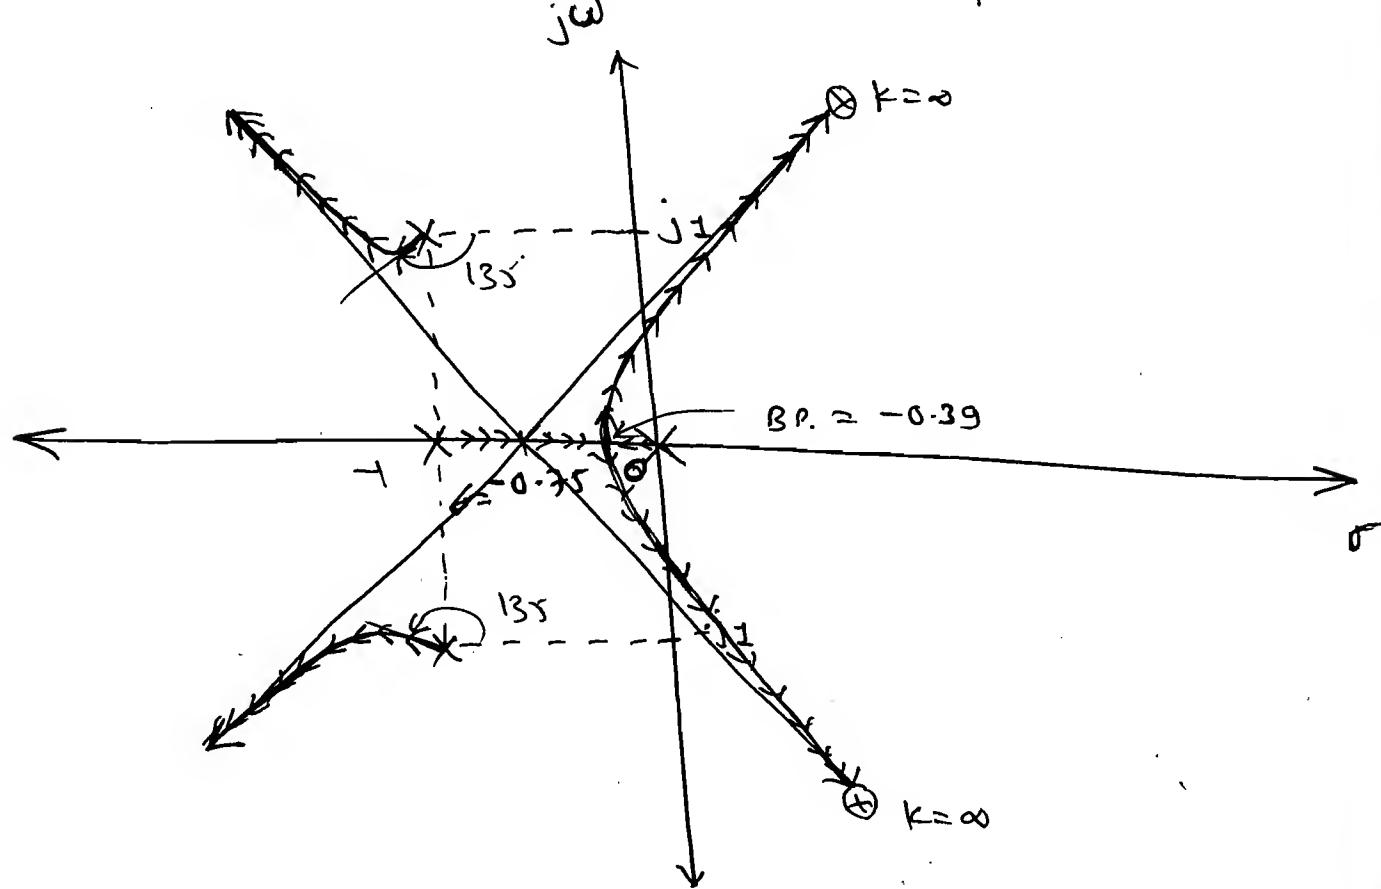

more accurate.

⇒ Addition of zero makes the system quick response.

$$k=0 \rightarrow s^2 + s = 0 \Rightarrow s = 0, -1.$$

$$k=1 \rightarrow s^2 + s + 1 - s = 0 \Rightarrow s = \pm j1.$$

$$k=2 \rightarrow s^2 + s + 2 - 2s = 0.$$

$$s^2 - s + 2 = 0 \Rightarrow s = 1 \pm j\sqrt{3}.$$

Note: For a complete Root locus the range of k value is from $-\infty$ to $+\infty$.

Draw the Complete root locus the range of $k = -\infty$ to $+\infty$.

$$G_H(s) = \frac{k}{s(s+2)}.$$

Soln:

$$\text{IRL} \rightarrow -\infty < k < 0 \Rightarrow 0 \rightarrow \rightarrow \rightarrow X \quad k=-\infty \quad k=0$$

By defn it

$$\text{CE} \rightarrow 1 + G_H = 0 \Rightarrow 1 + \frac{k}{s(s+2)} = 0$$

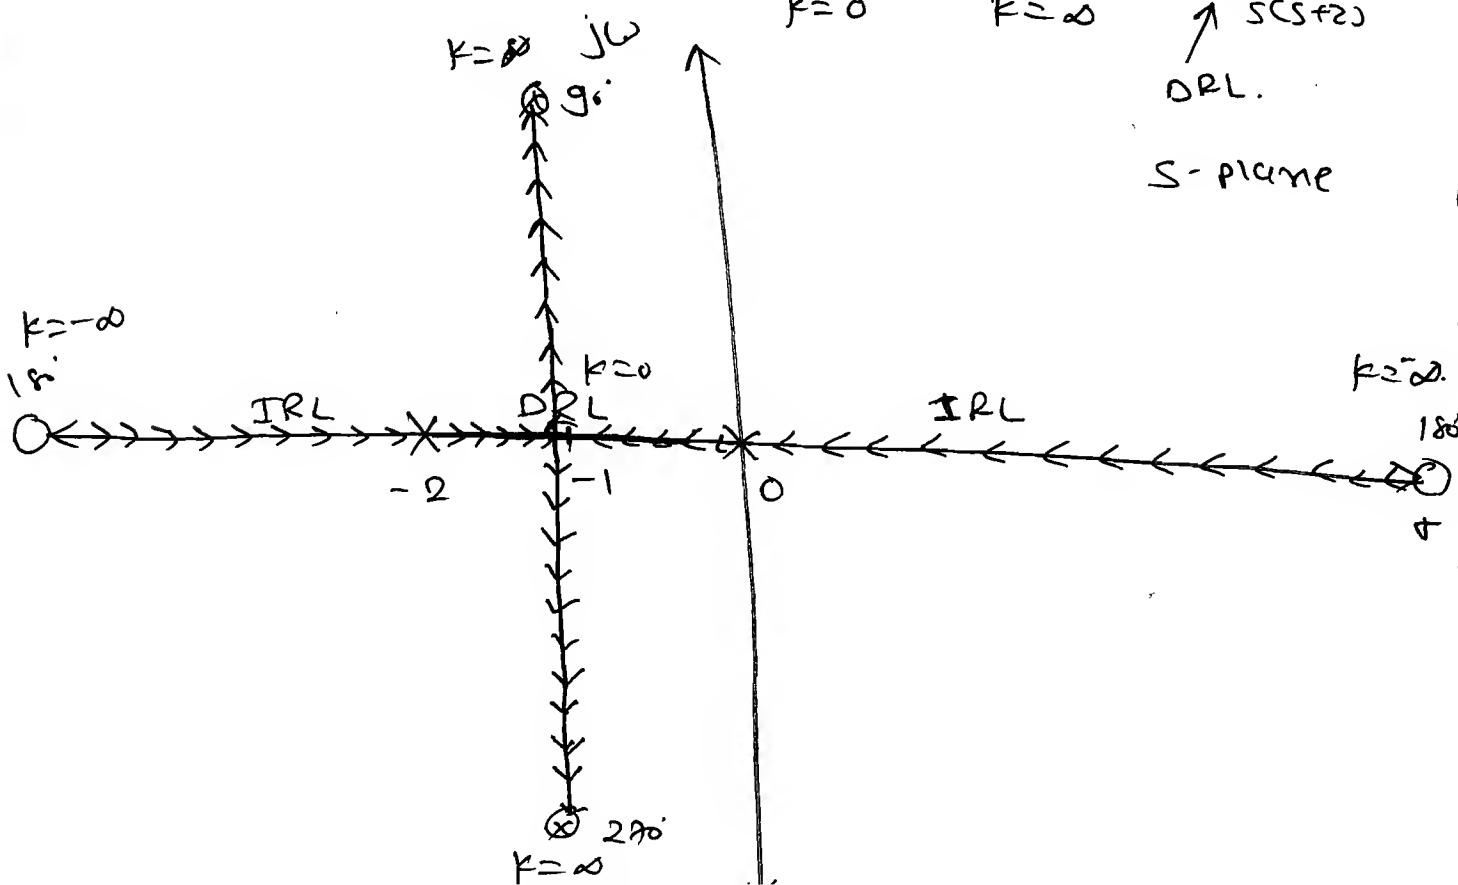

IRL

$$\text{DRL} \rightarrow 0 < k < \infty \Rightarrow X \rightarrow \rightarrow \rightarrow 0 \quad k=0 \quad k=\infty$$

$$1 + \frac{k}{s(s+2)} = 0$$

DRL

S-plane

$$\Rightarrow A = \frac{-2-0-0}{p-2}$$

$$= \frac{-2-0-0}{2-2}$$

$$\boxed{\sigma = -1}$$

$$\begin{matrix} p: & 2 \\ z: & 0 \end{matrix} \Rightarrow n = p-z = 2.$$

$$\theta = \frac{(2z)180}{p-2}$$

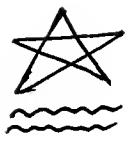

$$= \frac{2 \times 180}{2}$$

$$\therefore \boxed{\theta = 0^\circ, 180^\circ}$$

$$\xrightarrow{BP} k = -s^2 - 2s$$

$$\frac{dk}{ds} = -2s - 2$$

$$\Rightarrow \boxed{s = -1}$$

Bode

Plot:

⇒ Purpose:

⇒ To draw the frequency response of OLTF.

⇒ To find the closed loop system

Stability.

⇒ To find the Gain margin, phase margin, gain cross over frequency, phase cross over frequency.

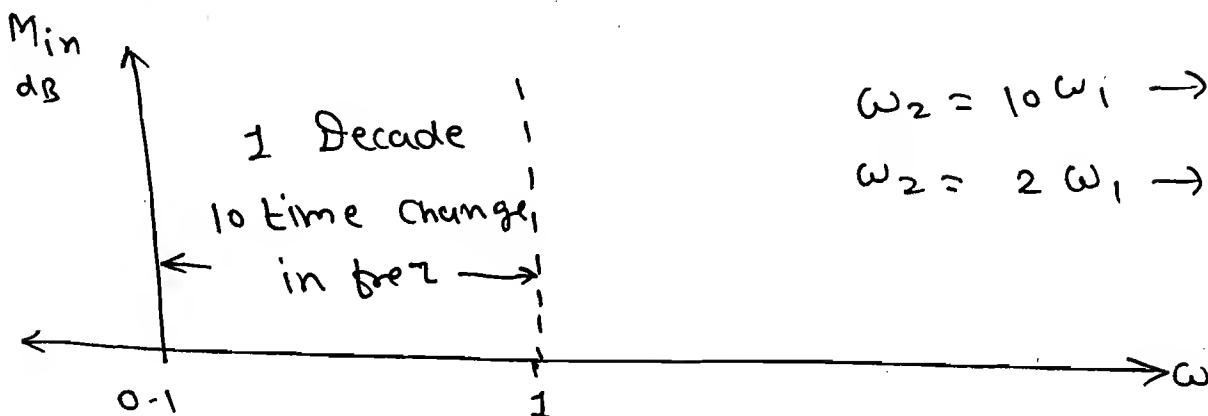

⇒ To find the relative stability by using G_m & P_m . If the G_m & P_m is very very large then the system is more relative stable. but the system response is slow. If G_m & P_m is very small, start worse then the system become less relative stable and more oscillatory.

⇒ The optimum range of G_m is 5 to 10 dB & P_m is 30 to 40.

⇒ The Bode plot consist the two plots. one is the magnitude plot and other is phase plot.

\Rightarrow Bode Plot \rightarrow (i) Magnitude plot .
 (ii) Phase plot.

\Rightarrow Magnitude Plot:

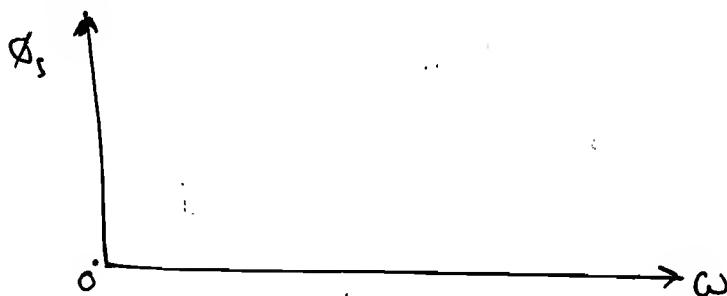

$$\omega_2 = 10\omega_1 \rightarrow \text{decade}$$

$$\omega_2 = 2\omega_1 \rightarrow \text{octave.}$$

$$\Rightarrow 20 \log 10 \longleftrightarrow 20 \log 2$$

$$20 \text{ dB/decade} \longleftrightarrow 6 \text{ dB/octave.}$$

\Rightarrow Phase plot:

* Procedure to draw the Bode Plot:

- 1) S is replaced by $j\omega$ to convert it to freq. domain.
- 2) Write the magnitude and convert into (dB).

$$\Rightarrow \text{The Magg. in dB } M_{\text{dB}} = 20 \log |G_H(j\omega)|.$$

3) Find the phase angle using;

$$\phi = \tan^{-1} \left(\frac{I_p}{R_p} \right).$$

4) Vary the ' ω ' from min to max and draw the magnitude and phase plot approximately.

(a) Draw the Bode plot for $G(s) \cdot H(s) = K$.

Soln:

$$G(s) \cdot H(s) = K$$

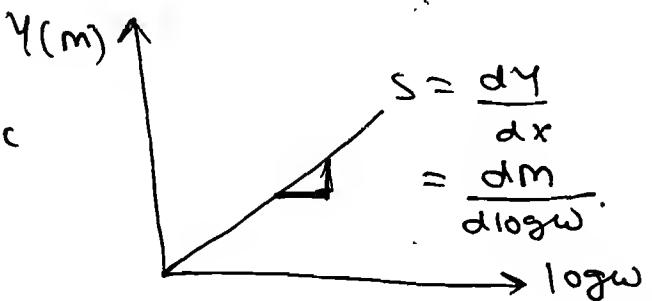

$$\Rightarrow s \rightarrow j\omega$$

$$G_H(j\omega) = K$$

$$|G_H(j\omega)| = K$$

$$M_{\text{in dB}} = 20 \log |G_H(j\omega)| = \boxed{20 \log K}$$

$$\Rightarrow \text{Slope} = \frac{dm}{d \log \omega} = 0 \text{ dB/dec}$$

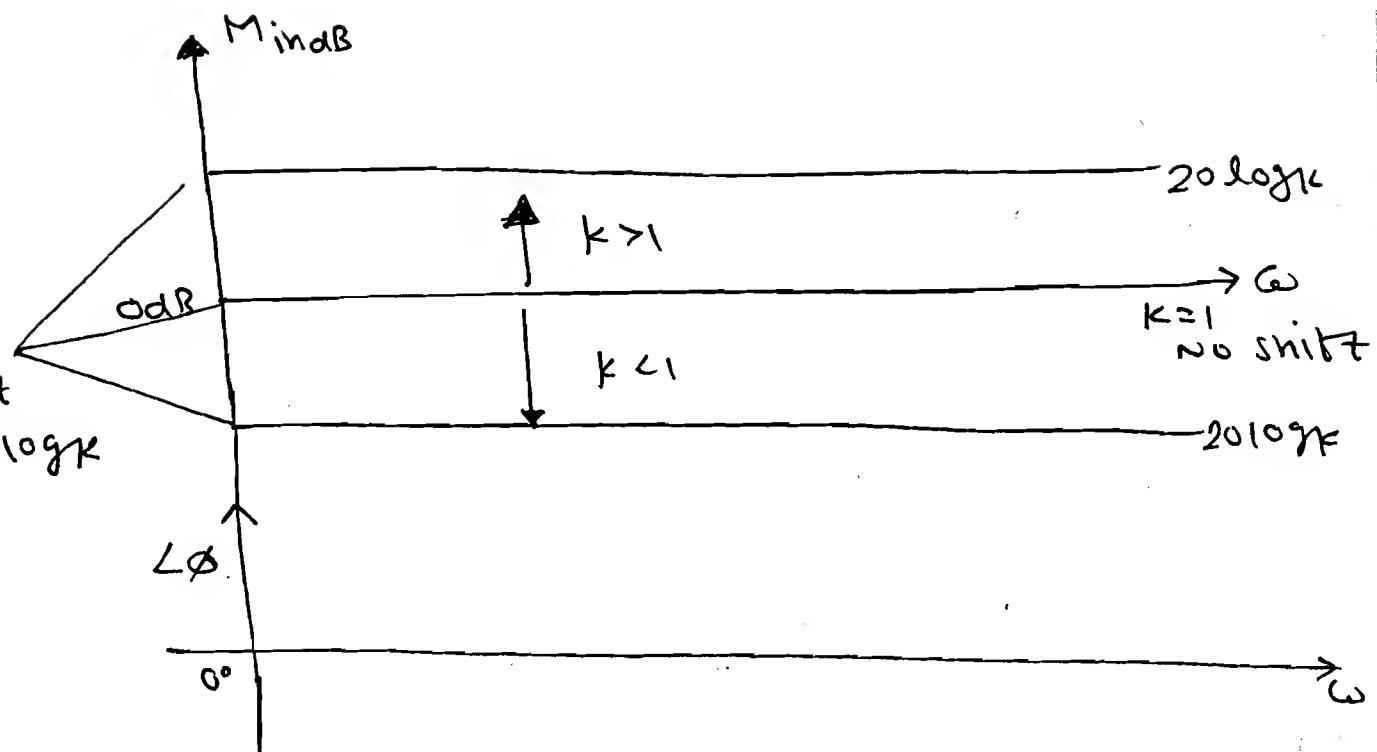

$$\rightarrow k = 1 \Rightarrow M_{\text{dB}} = 0 \text{ dB}$$

$$M_{\text{in dB}} = 20 \log K \quad \begin{array}{l} \rightarrow k > 1 (10) \Rightarrow M_{\text{dB}} = 20 \text{ dB} \\ \rightarrow k < 1 (0.1) \Rightarrow M_{\text{dB}} = -20 \text{ dB.} \end{array}$$

$$\Rightarrow \angle \phi = \angle G_H(j\omega) = \angle(K + j0) \\ = \tan^{-1}(0/K)$$

$$\boxed{\angle \phi = 0^\circ}$$

Note: The phase plot is independent of K value where as the shift in the magnitude plot depends on K value.

* n -Poles at origin n -Zeros at origin.

$$G_H(s) = \frac{1}{s^n}$$

$$G_H(s) = s^n$$

$$\rightarrow s \rightarrow j\omega$$

$$s \rightarrow j\omega$$

$$G_H(j\omega) = \frac{1}{(j\omega)^n}$$

$$G_H(j\omega) = (j\omega)^n$$

$$\rightarrow M = \frac{1}{\omega^n}$$

$$\rightarrow M = (\omega)^n$$

$$\Rightarrow M_{\text{in dB}} = 20 \log \left(\frac{1}{\omega^n} \right)$$

$$\rightarrow M_{\text{in dB}} = 20n \log(\omega)$$

$$= -20n \log(\omega)$$

= Slope

$$\Rightarrow \text{Slope } \frac{dM}{d \log \omega} = -20n$$

$$\frac{dM}{d \log \omega} = 20n$$

\Rightarrow

$$\Rightarrow \angle \phi = \frac{1}{\angle j\omega \dots n \text{ times}}$$

$$\Rightarrow \angle \phi = \angle j\omega \dots n \text{ times}$$

$$\Rightarrow \angle \phi = +90^\circ n.$$

$$\Rightarrow \angle \phi = -90^\circ n$$

* Conclusion:

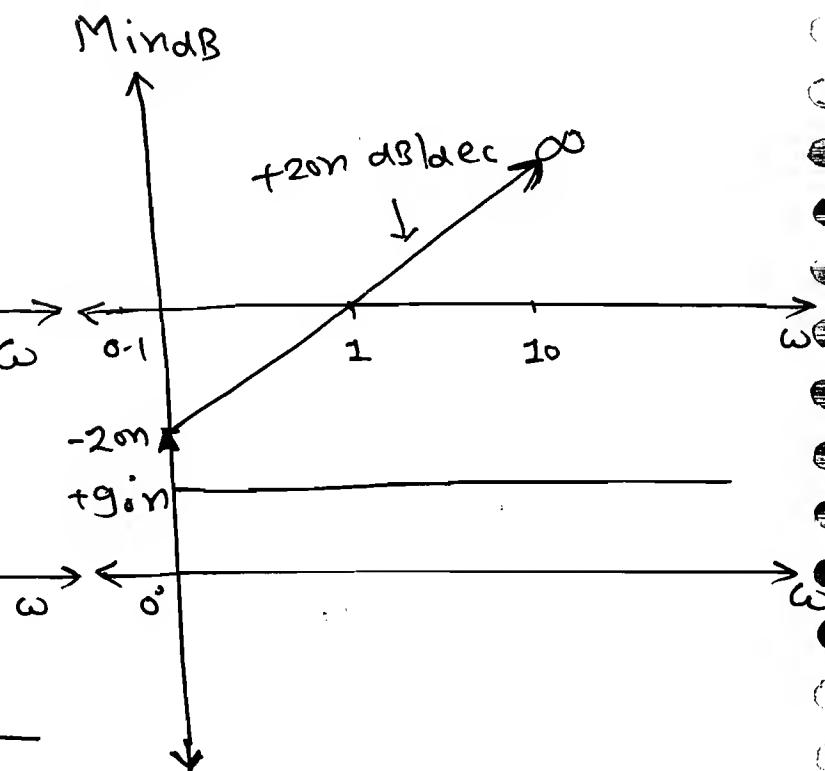

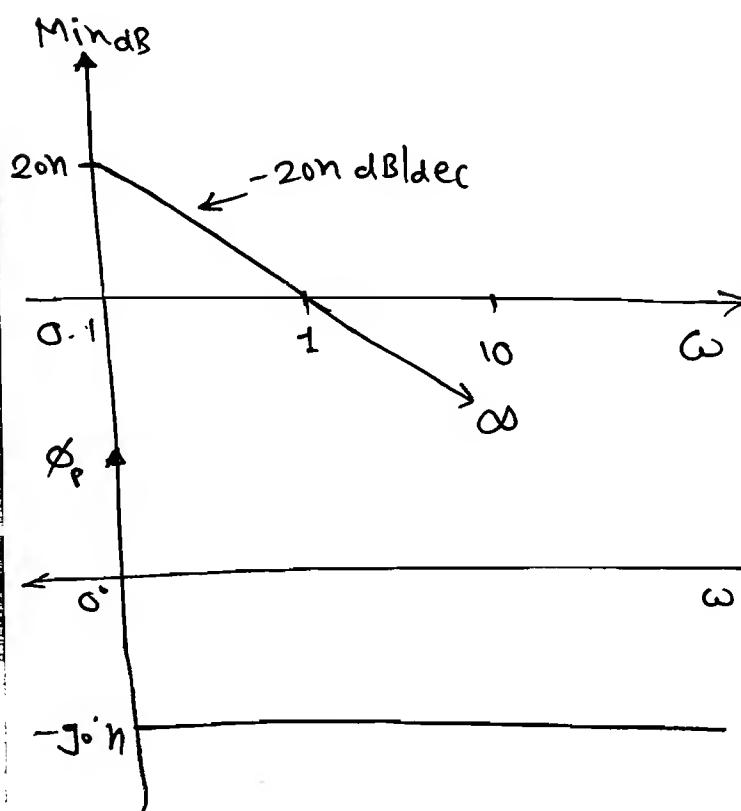

$$S = -20n \text{ dB/dec}$$

$$\phi = -90^\circ n$$

* Conclusion:

$$S = +20n \text{ dB/dec}$$

$$\phi = +90^\circ n.$$

\Rightarrow Whenever the transfer function consists of poles and zeros at origin then the plot starts with a magnitude of ∞ and it should be passed through 0 db line intersect at $\omega=1$ and extended upto ∞ if no corner freq.

exist when $K = 1$.

(a) Draw the Bode Plot $G(s) \cdot H(s) = \frac{100}{s^8}$.

Soln: $G(s) \cdot H(s) = \frac{100}{s^8}$.

$$\therefore M = \frac{100}{\omega^8}$$

$$M_{\text{dB}} = 20 \log \left(\frac{100}{\omega^8} \right).$$

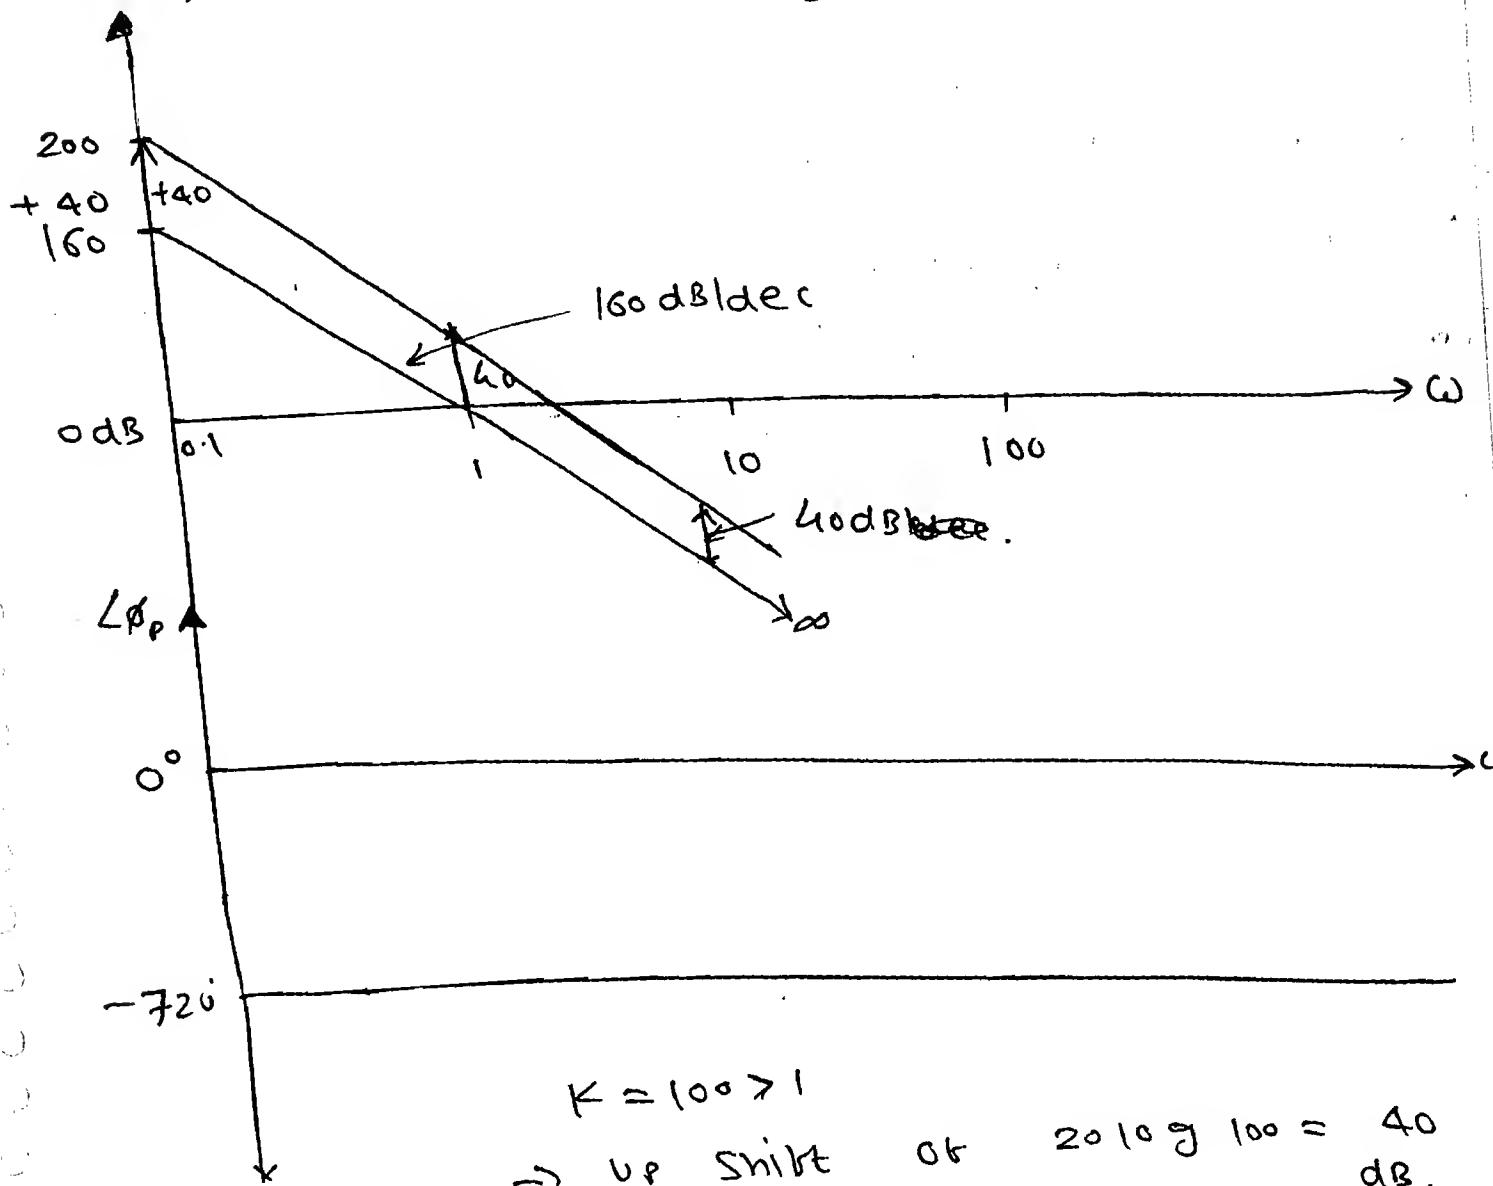

$$\phi = -8 \times 90^\circ = -720^\circ$$

\Rightarrow 8 pole at origin $s = -20n$

$$s = -20 \times 8$$

$$s = -160 \text{ dB/dec.}$$

M_{dB}

$$K = 100 > 1$$

\Rightarrow up shift of $20 \log 100 = 40 \text{ dB}$.

n-finite Poles

$$G_H(s) = \frac{1}{(s\tau + 1)^n}$$

$$s \rightarrow j\omega$$

$$G_H(j\omega) = \frac{1}{(j\omega\tau + 1)^n}$$

$$M = \left(\frac{1}{\sqrt{(\omega\tau)^2 + 1}} \right)^n$$

$$\text{MdB}_{\text{actual}} = -20n \log \sqrt{(\omega\tau)^2 + 1}$$

$$\Rightarrow \phi_{\text{actual}} = \frac{\angle 1+j0}{\angle (1+j\omega\tau) \dots n \text{ times}}$$

$$\Rightarrow \phi_{\text{actual}} = -n \tan^{-1}(\omega\tau)$$

* Asymptotic / Approximate

$$\text{Case-1: } \frac{\omega\tau < 1}{\text{neglect } \omega\tau}$$

$$M_{\text{asy}} = -20 \log 1 = 0 \text{ dB/dec}$$

$$S = \frac{dM}{d \log \omega} = 0 \text{ dB/dec}$$

$$\phi_{\text{asm}} = \frac{\angle 1+j0}{\angle 1+j0 \dots n \text{ times}}$$

$$\phi_{\text{asy}} = 0^\circ$$

$$\text{Case-2: } \underline{\omega\tau > 1}$$

n-finite zeros

$$G_H(s) = (s\tau + 1)^n$$

$$G_H(j\omega) = (j\omega\tau + 1)^n$$

$$M = \left(\sqrt{(\omega\tau)^2 + 1} \right)^n$$

$$\text{MdB}_{\text{actual}} = +20 \log \sqrt{(\omega\tau)^2 + 1}$$

$$\phi_{\text{actual}} = \angle (1+j\omega\tau) \dots n \text{ times}$$

$$\phi_{\text{actual}} = +n \tan^{-1}(\omega\tau)$$

* Asymptotic / Approximate:

$$\text{Case-1: } \frac{\omega\tau < 1}{\text{neglect } \omega\tau}$$

$$M_{\text{asy}} = 20 \log 1 = 0 \text{ dB/dec.}$$

$$S = \frac{dM}{d \log \omega} = 0 \text{ dB/dec.}$$

$$\phi_{\text{asm}} = \angle 1+j0 \dots n \text{ times}$$

$$\phi_{\text{asm}} = 0^\circ$$

$$\text{Case-2: } \omega\tau > 1$$

Neg - 1

Neg - 1

$$M_{asym} = -20n \log(\omega\gamma)$$

$$M_{asym} = +20n \log(\omega\gamma).$$

$$M_{asym} = -20n \log \omega - 20n \log \gamma; M_{asym} = +20n \log \omega - 20n \log \gamma$$

$$S = \frac{dm}{d \log \omega} = -20n \text{ dbldec}$$

$$S = \frac{dm}{d \log \omega} = +20n \text{ dbldec.}$$

$$\phi_{asm} = \frac{\angle 1 + j\alpha}{\angle j\omega\gamma - n \text{ times}}$$

$$\phi_{asm} = \angle j\omega\gamma - n \text{ times}$$

$$\phi_{asm} = -90^\circ$$

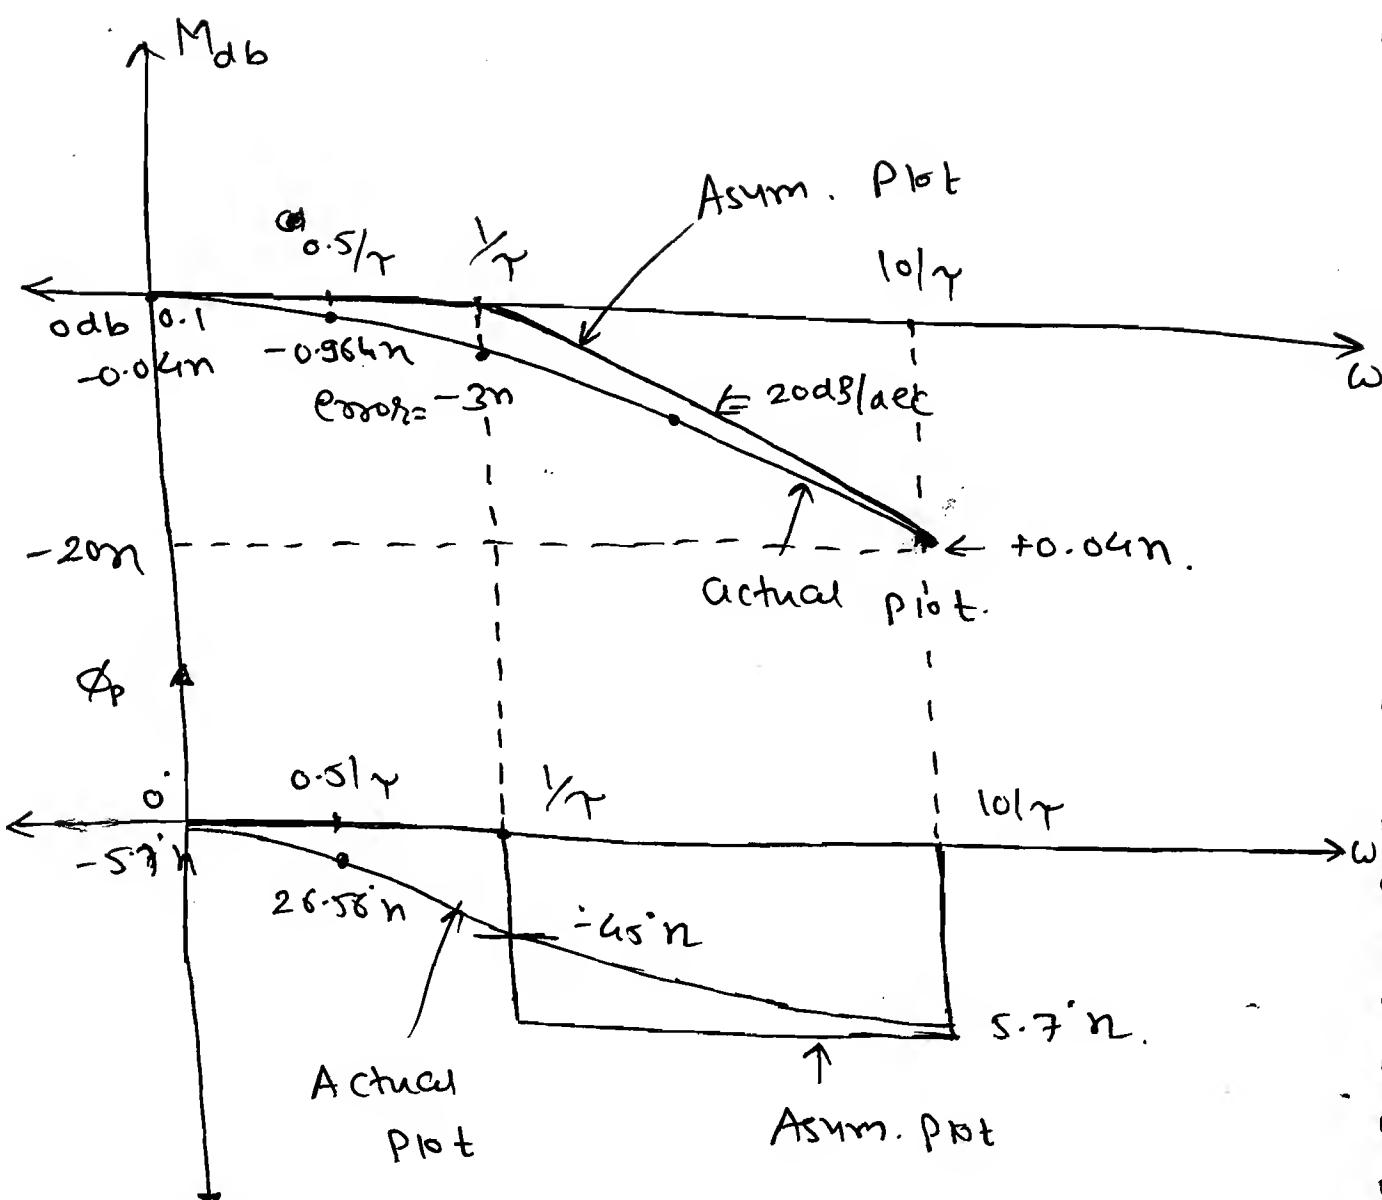

$$\phi_{asm} = +90^\circ.$$

* Corners Frequency:

⇒ The freq. at which slope changing from one level to another level is called corners freq.

⇒ The corners freq. is nothing but the finite poles and zeros location in the form of magnitude.

	S	ϕ
$< CF$	0 dbldec	0
$> CF$	$-20n \text{ dbldec}$	-90°

$$\Rightarrow \text{Error} = \underbrace{\text{Actual value}}_{\text{TF}} - \underbrace{\text{Assym. value}}_{\text{plot}}$$

\Rightarrow To get the errors in the plot the Actual value is obtained from the founded b^n and the asymptotic value is obtain from the Plot.

* Error at Corner Freq. :-

* Magnitude plot:

$$\Rightarrow \text{Error at CF } \omega = \frac{1}{T} = \left\{ \begin{array}{l} \text{Actual} \\ \omega = \frac{1}{T} \end{array} \right\} - \left\{ \begin{array}{l} \text{Assumed} \\ \omega = \frac{1}{T} \end{array} \right\}$$

$$= -20 \log \sqrt{\left(\frac{1}{T}\right)^2 + 1} - 0$$

$$= -20 \log \sqrt{2} \cdot n - 0$$

$$= -3n - 0$$

$$= -3n \text{ dB.}$$

\Rightarrow Error is Symm. about the corner freq.

* Phase plot:

$$\Rightarrow \text{Error at CF } \omega = \frac{1}{T} = \left\{ \begin{array}{l} \phi_{\text{Actual}} \\ \omega = \frac{1}{T} \end{array} \right\} - \left\{ \begin{array}{l} \phi_{\text{Assymptotic}} \\ \omega = \frac{1}{T} \end{array} \right\}$$

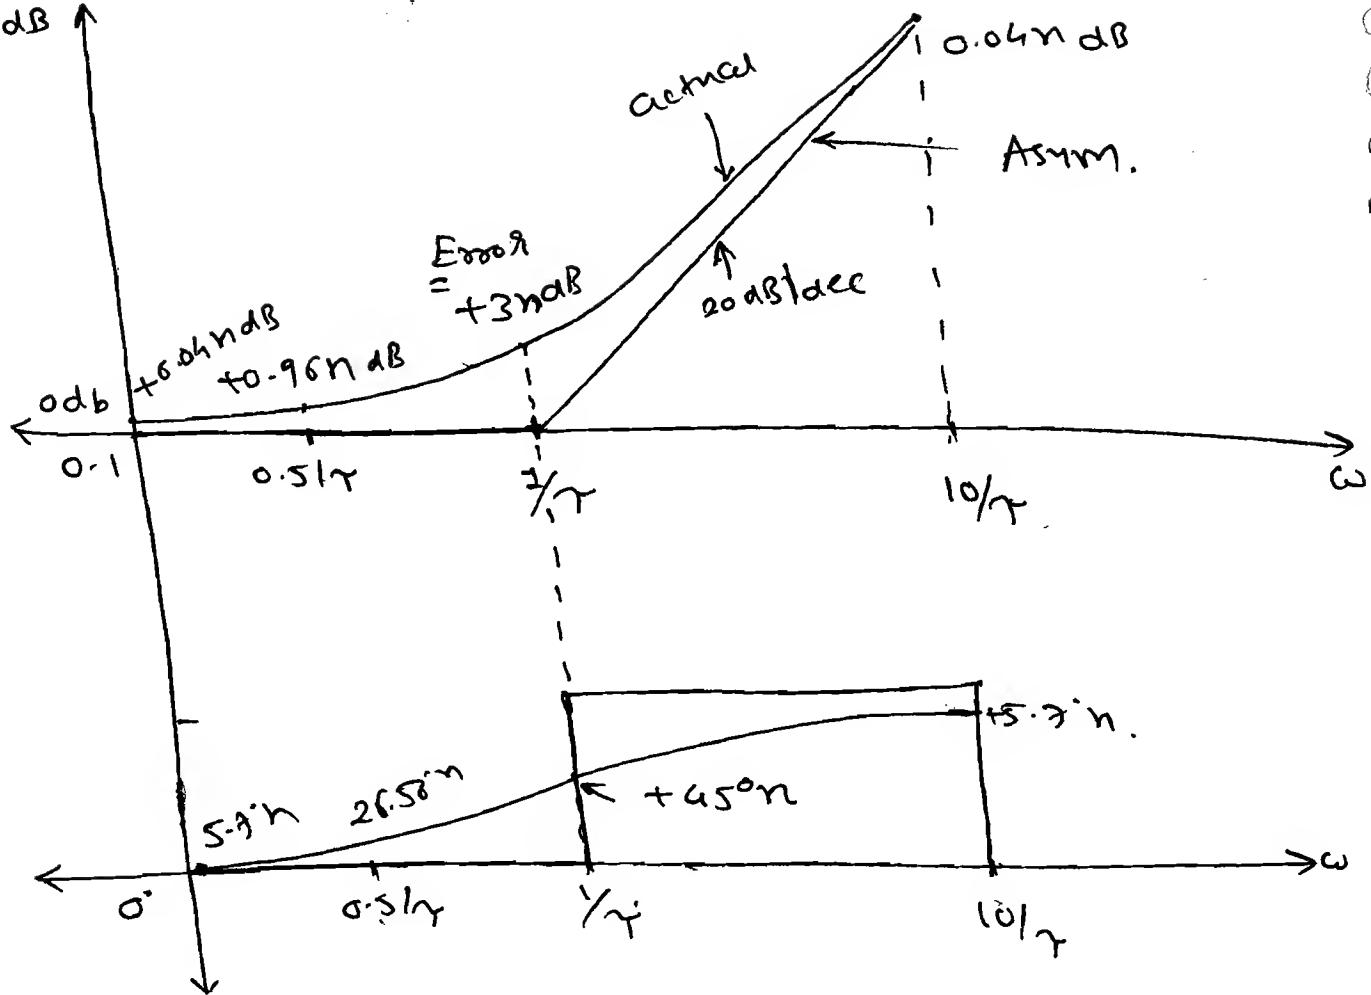

$$= -n \tan^{-1}(\omega T) - 0$$

$$= -n \tan^{-1}(1) - 0$$

$$= -45^\circ n - 0$$

$$= -45^\circ n$$

\Rightarrow The error is max. at corner freq.,
the error is symm. about corner freq.
whenever the error exist below 1 decade
the same error exist after one decade also.

a) Draw the Bode Plot to 92

$$G_H(s) = \frac{10(s+5)^2}{(s)(s+2)(s+10)}$$

Soln: $G_H(j\omega) = \frac{10(j\omega+5)^2}{(j\omega)(j\omega+2)(j\omega+10)}$

$$M = |G_H(j\omega)| = \frac{10 \cdot (\omega^2 + 25)}{\omega \cdot \sqrt{\omega^2 + 4} \cdot \sqrt{\omega^2 + 100}}$$

$$\angle \alpha = \phi = -90^\circ - \tan^{-1}(\omega_1) + 2\tan^{-1}(\omega/5) - \tan^{-1}(\omega/10)$$

$$M_{dB} = 20 \log_{10} \left[\frac{10 \cdot (\omega^2 + 25)}{\omega \cdot \sqrt{\omega^2 + 4} \cdot \sqrt{\omega^2 + 100}} \right]$$

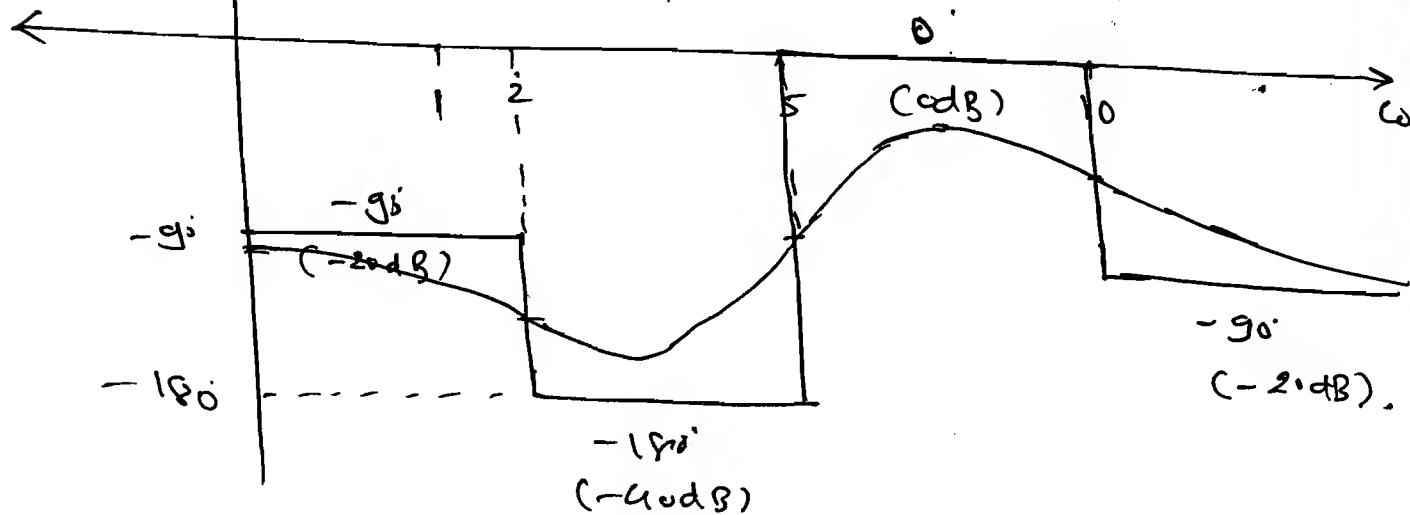

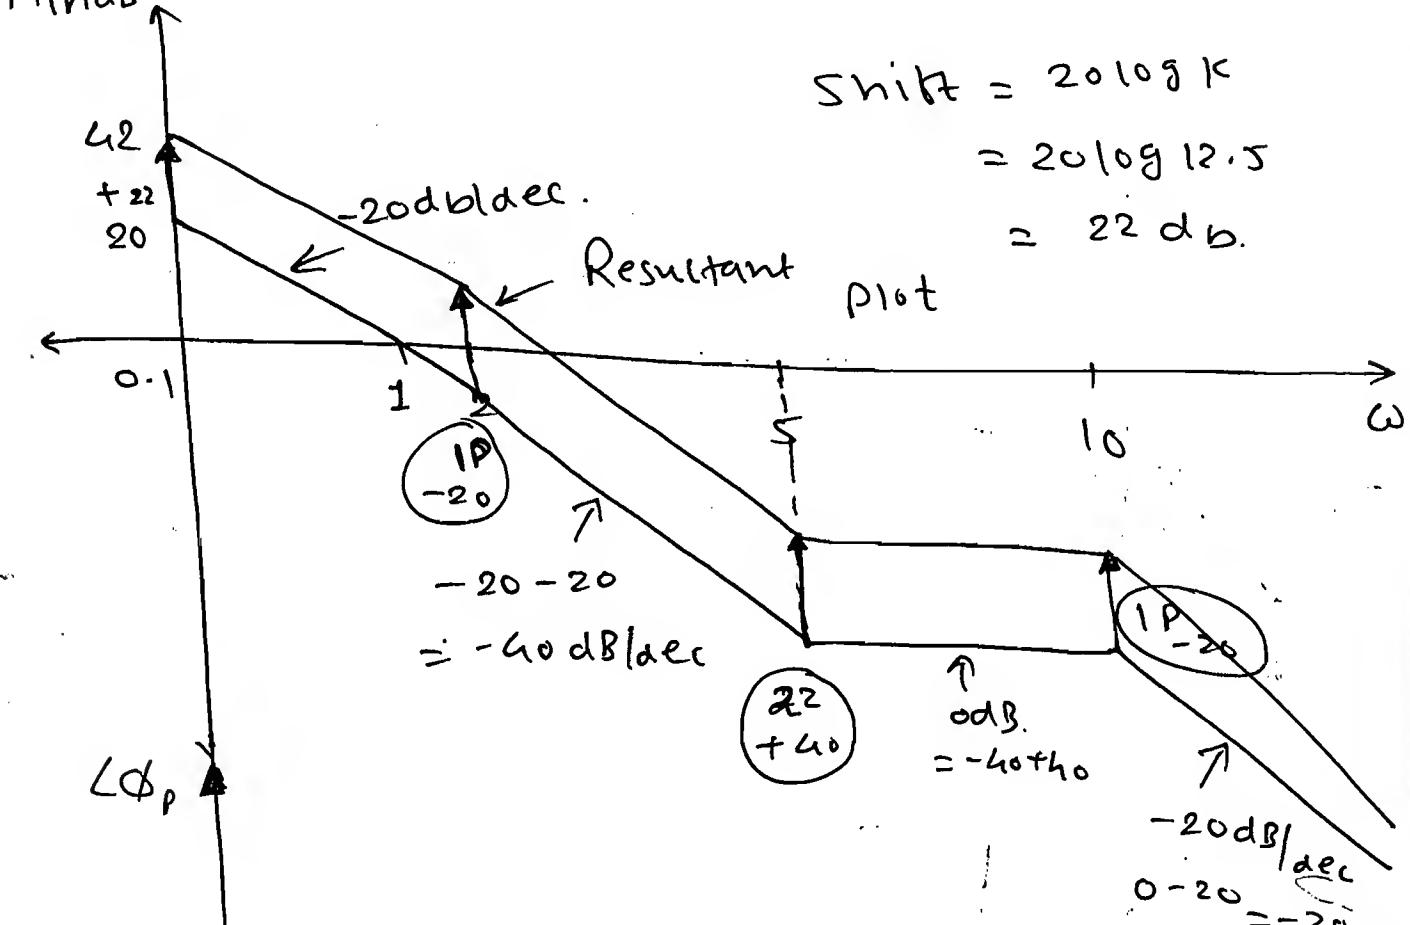

\Rightarrow Time constant form:

$$G_H(s) = \frac{10 \times 25}{2 \times 10} \frac{(1 + s/5)^2}{(1 + s/2)(1 + s/10)} \quad CF.$$

$$T_{P_0} \propto s \Rightarrow -20 \text{ dB/dec.}$$

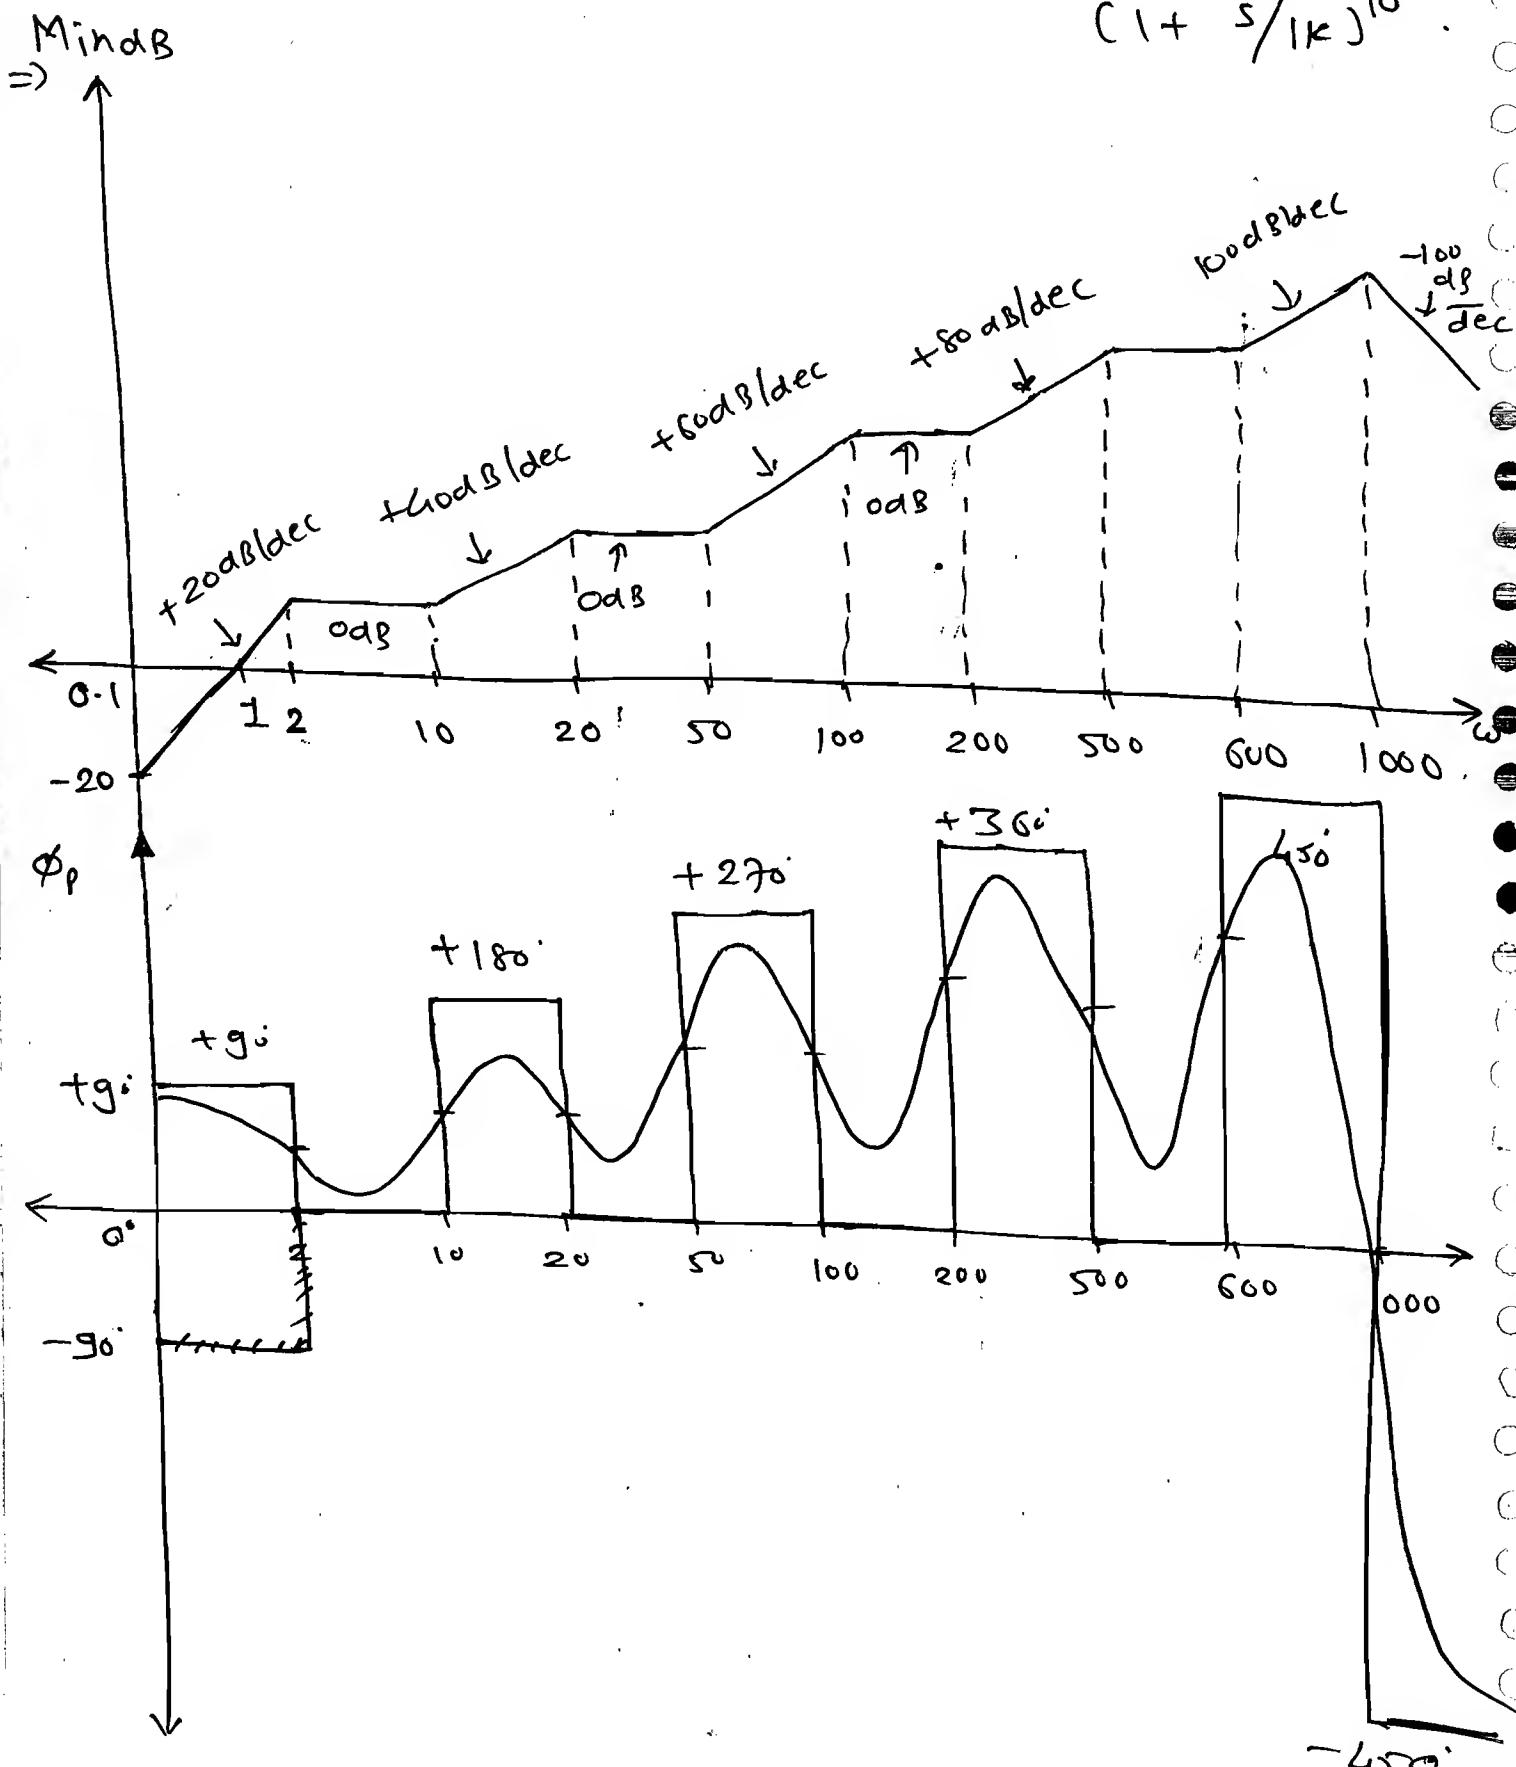

$$\left. \begin{array}{l} \omega_1 = 2 \\ \omega_2 = 5 \\ \omega_3 = 10 \end{array} \right\} \rightarrow CF.$$

MindB

⇒ The Initial Slope of the plot is given by Poles and Zeros located at origin.

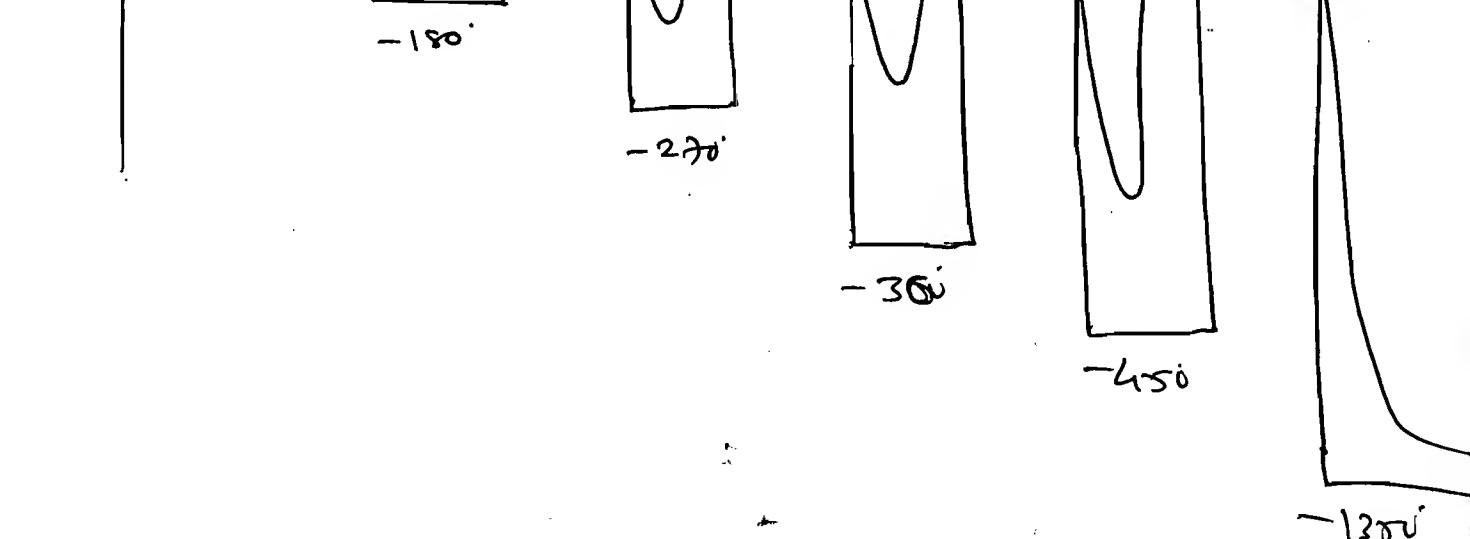

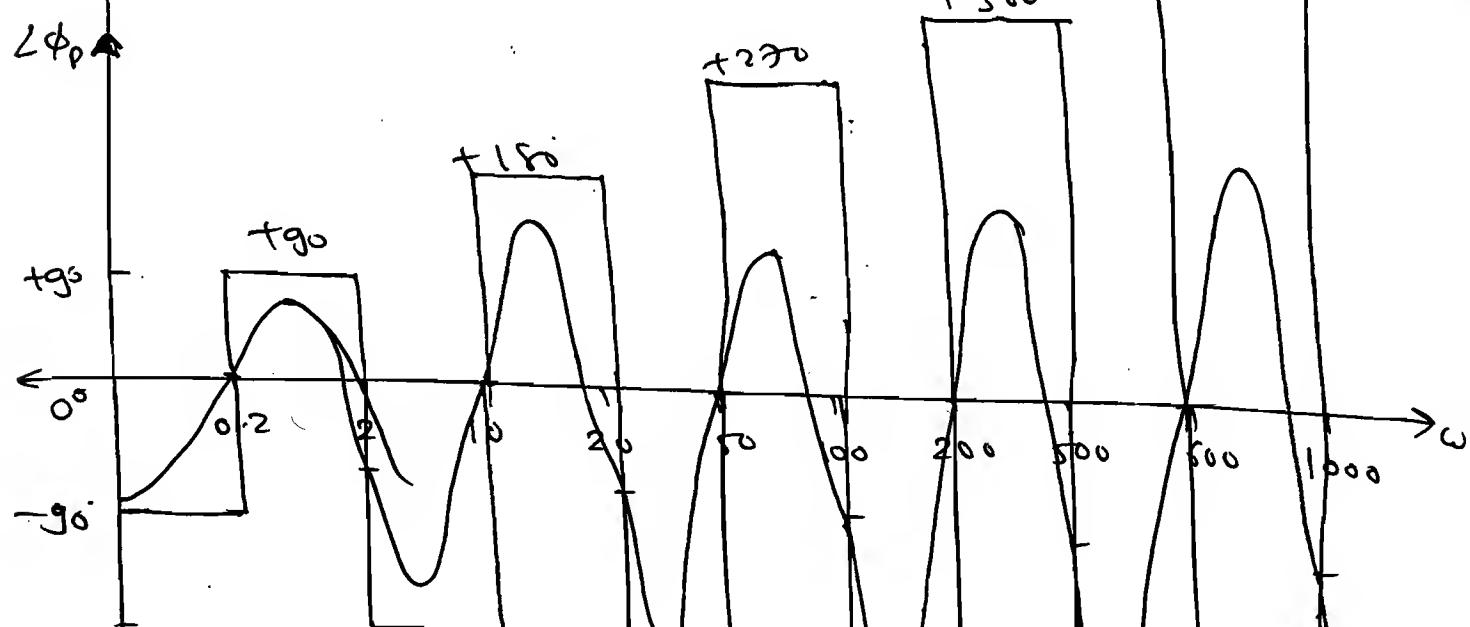

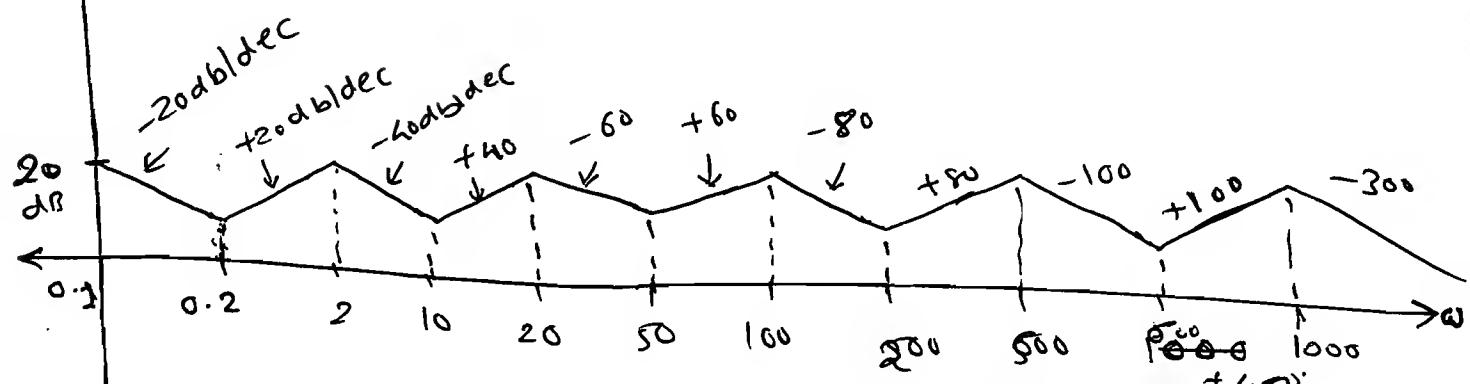

c) $G(s) = \frac{s(1+s/10)^2(1+s/50)^3(1+s/200)^4(1+s/600)^5}{(1+s/2)(1+s/20)^2(1+s/100)^3(1+s/500)^4(1+s/1k)^{10}}$

(a)

$$G(s) = \frac{(1 + s/0.2)^2 (1 + s/10)^4 (1 + s/50)^6 (1 + s/200)^8}{s (1 + s/2)^3 (1 + s/20)^5 (1 + s/100)^7 (1 + s/500)^9} \times (1 + s/600)^{10} \times (1 + s/1000)^{20}$$

$s = \omega j$
Mindb

(a) Find the change in slope at the following corner freqs

- 1) $\omega = 2$
- 2) $\omega = 10$
- 3) $\omega = 20$
- 4) $\omega = 50$
- 5) $\omega = 100$
- 6) $\omega = 200$
- 7) $\omega = 500$
- 8) $\omega = 1K$.

→ Find the slope of the line bet'n two corner freqs.

- 1) $\omega = 2 \text{ to } 10$.
- 2) $\omega = 20 \text{ to } 50$.
- 3) $\omega = 200 \text{ to } 500$
- 4) 4) High freq asymptote

→ Find the slopes around the corner freq.

- 1) $\omega = 2, 20, 200, 1K$. for.

$$G(s) \cdot H(s) = \frac{s^5 \left(1 + s/10\right)^{20} \left(1 + s/50\right)^{50} \left(1 + s/200\right)^{200} \left(1 + s/500\right)^{500}}{\left(1 + s/2\right)^{10} \left(1 + s/20\right)^{30} \left(1 + s/100\right)^{100} \left(1 + s/500\right)^{500} \left(1 + s/1K\right)^{1K}}$$

Soln:

$$\text{Change in slope} = \frac{\text{New slope} - \text{Previous slope}}{}$$

$$\Rightarrow \begin{matrix} >20 \\ \text{IN} \end{matrix} \quad \begin{matrix} <50 \\ \text{out} \end{matrix} \Rightarrow \begin{matrix} P = 40 \\ Z = 25 \end{matrix}$$
$$\Rightarrow 40 - 25 = 15P \Rightarrow -300.$$

3) $\omega = 200$ to 500

$$\Rightarrow \begin{matrix} >200 \\ \text{IN} \end{matrix} \quad \begin{matrix} <500 \\ \text{out} \end{matrix} \Rightarrow \begin{matrix} P = 140 \\ Z = 275 \end{matrix}$$
$$\Rightarrow P - Z = 140 - 275 = -135 \Rightarrow +135$$
$$+135 \Rightarrow +2700.$$

(4) $\omega = 4$) ω

$$\left. \begin{matrix} P = 1640 \\ Z = 875 \end{matrix} \right\} \Rightarrow P = 765 \Rightarrow -1530^\circ.$$

(3) Find the slopes around the freq.

(i) $\omega = 2$

$$\begin{array}{ll} >2 & <2 \\ \text{IN} & \text{out} \\ \downarrow & \downarrow \\ P = 10 & Z = 5 \\ \underline{Z = 5} & \underline{P = 0} \\ P = 5 & Z = 5 \\ \Rightarrow -100 & \Rightarrow +100 \end{array}$$

(ii) $\omega = 200$

$$\begin{array}{ll} >200 & <200 \\ \text{IN} & \text{out} \\ \downarrow & \downarrow \\ P = 140 & Z = 275 \\ \underline{Z = 275} & \underline{Z = 75} \\ Z = 135 & P = +65 \\ \Rightarrow 2700 & \Rightarrow -1300 \end{array}$$

(iii) $\omega = 20$

$$\begin{array}{ll} >20 & <20 \\ \text{IN} & \text{out} \\ \downarrow & \downarrow \\ P = 40 & P = 10 \\ \underline{Z = 25} & \underline{Z = 25} \\ P = 15 & Z = 15 \\ \Rightarrow -300 & \Rightarrow +300 \end{array}$$

(iv) $\omega = 1K$

$$\begin{array}{ll} >1000 & <1000 \\ \text{IN} & \text{out} \\ \downarrow & \downarrow \\ P = 1640 & Z = 875 \\ \underline{Z = 875} & \underline{Z = 235} \\ P = 765 & Z = 235 \\ \Rightarrow -151300 & \Rightarrow +4300 \end{array}$$

* Transfer Function from the magnitude plot:

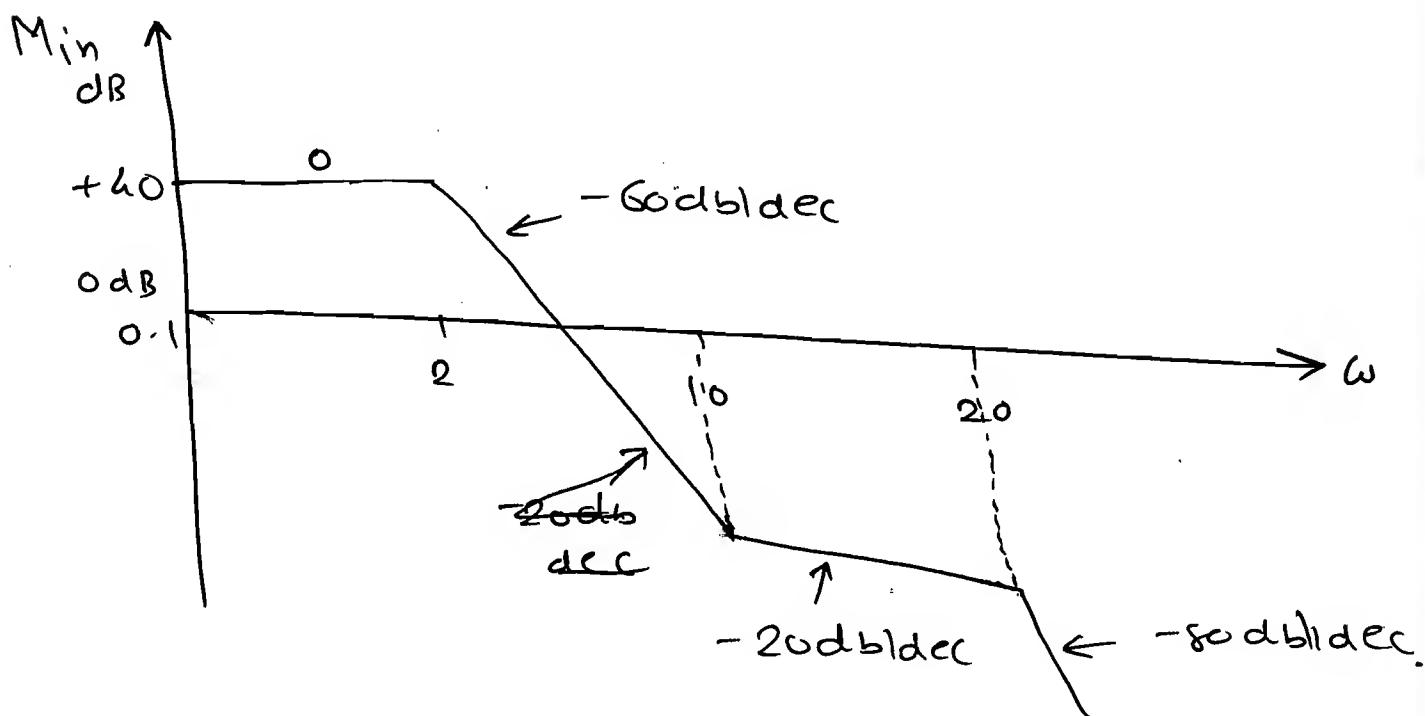

⇒ Procedure:

- 1) Observe the initial slope it gives the no. of zeros and poles at origin.
- 2) find the change in slope at each end every corner freq. The change

in Slope is (+ve), consider finite zeros.
 If change in slope is (-ve) consider the finite poles.

3) Find the K value by using known magnitude at known freq.

(Q) Find the TF to the given asymptotic magnitude plot of a minimum phase system.

Soln: The initial slope is zero so no poles and zeros at origin.

$$\Rightarrow CS = -60 - 0 = \underset{\substack{\uparrow \\ \text{poles}}}{{\ominus}60} \underset{\substack{\uparrow \\ 20 \times 3}}{\rightarrow} 3 \text{ poles at } \omega = 2.$$

$$\Rightarrow CS = -20 - (-60) = \underset{\substack{\uparrow \\ \text{zeros}}}{{\oplus}40} \rightarrow \underset{\substack{\uparrow \\ 2 \times 20}}{\rightarrow} 2 \text{ zeros at } \omega = 10.$$

$$\Rightarrow CS = -80 - (-20) = -60 \Rightarrow 3 \text{ poles at } \omega = 20.$$

$$\text{So, } G_H(s) = \frac{K \left(\frac{s}{10} + 1 \right)^2}{\left(\frac{s}{2} + 1 \right)^3 \left(\frac{s}{20} + 1 \right)^3}$$

$$\text{Let } \omega = 0.1 \quad m_{\text{indB}} = 0.1.$$

$$M = |G_H(j\omega)| = K \frac{\cancel{\left(\frac{\omega}{10} + 1 \right)} \cancel{\left(\frac{\omega}{20} + 1 \right)} \left[\left(\frac{\omega}{10} \right)^2 + 1 \right]}{\left[\left(\frac{\omega}{2} \right)^2 + 1 \right]^{3/2} \left[\left(\frac{\omega}{20} \right)^2 + 1 \right]^{3/2}}$$

$$\Rightarrow M_{\text{indB}} = 20 \log K + 40 \log \sqrt{1 + \left(\frac{0.1}{10} \right)^2} + 60 \log \sqrt{\left(\frac{0.1}{2} \right)^2 + 1} - 60 \log \sqrt{\left(\frac{0.1}{20} \right)^2 + 1}$$

$$M_{\text{db}} \Big|_{\omega=0.1} = 40$$

$$\therefore \frac{2}{40} = 20 \log_{10} K.$$

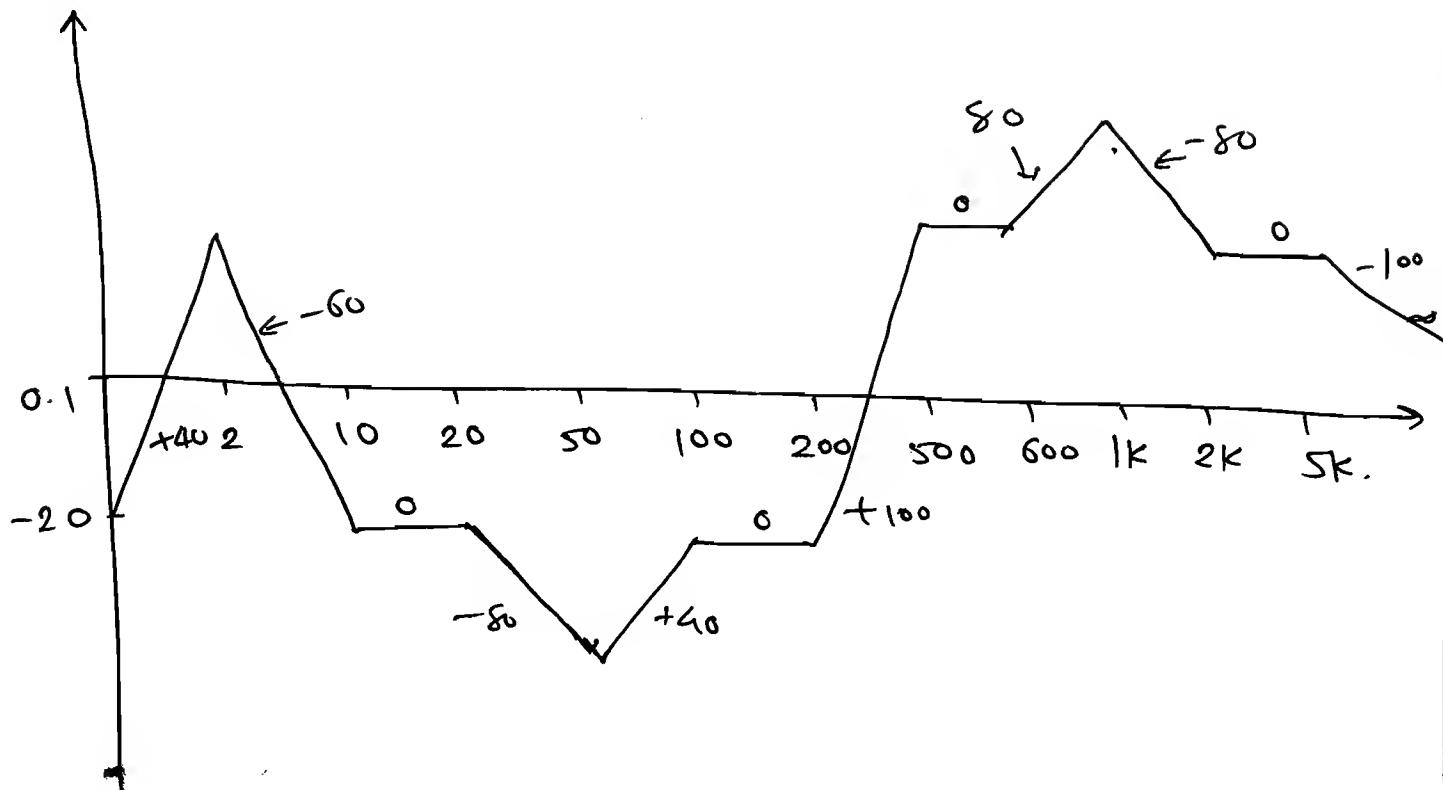

$$\Rightarrow 10 \log_{10} K = 2$$

$$K = 10^2 \Rightarrow$$

$$\boxed{K = 100}$$

Note: To get the K value compute the corner freq. with freq. where the magnitude is known it the corner freq. is greater than (∞) equal to one ($CF \geq 1$). then neglect the corner freq.

[Q] Find the TF:

Soln:

$$G_H(s) = K s^2 \left(\frac{s}{10} + 1 \right)^3 \left(\frac{s}{50} + 1 \right)^6 \left(\frac{s}{200} + 1 \right)^5 \left(\frac{s}{600} + 1 \right)^4 \left(\frac{s}{2k} + 1 \right)^8$$

$$\left(\frac{s}{2} + 1 \right)^3 \left(\frac{s}{20} + 1 \right)^4 \left(\frac{s}{100} + 1 \right)^2 \left(\frac{s}{500} + 1 \right)^{+5} \left(\frac{s}{1k} + 1 \right)^8$$

$$\times \left(\frac{s}{5k} + 1 \right)^5.$$

$$M_{\text{indB}} \Big|_{\omega=0.1} = -20.$$

$$\therefore -20 = 20 \log k + 40 \log \omega.$$

$$\Rightarrow -20 = 20 \log k + 40 \log 0.1.$$

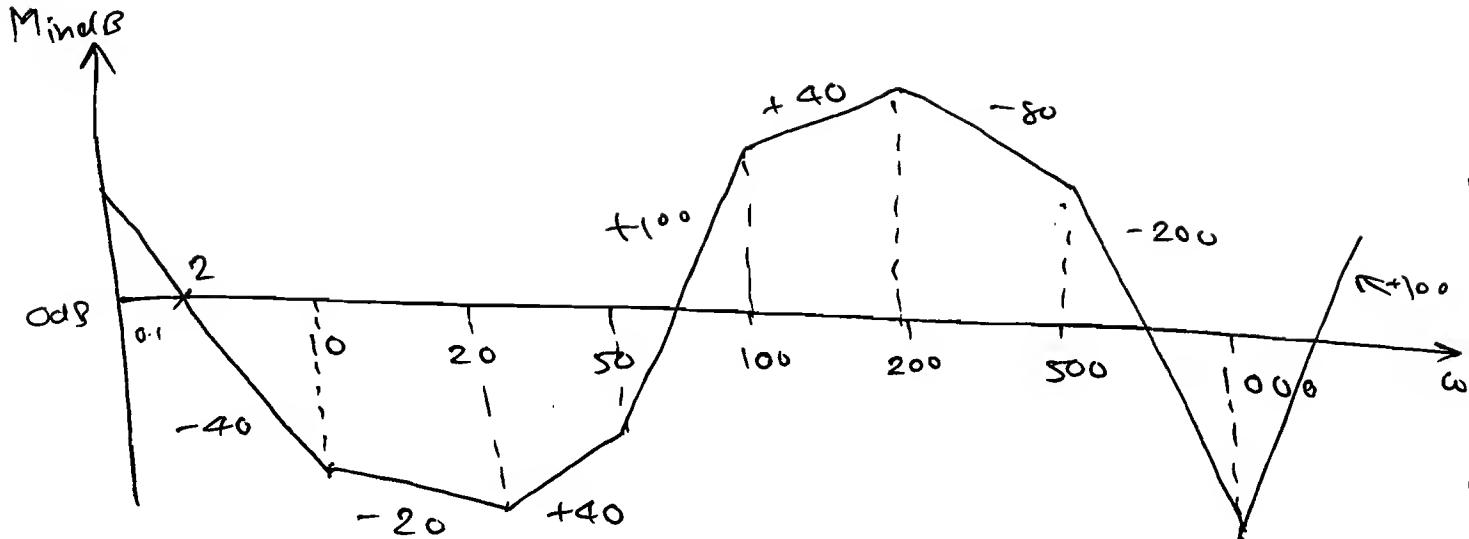

$$-20 = 20 \log k - 40.$$

$$20 \log k = 20$$

$$\Rightarrow \log k = 1$$

$$\Rightarrow \boxed{k = 10}$$

a) Find k

Soln:

$$G(s) = \frac{k \left(1 + \frac{s}{10}\right)^1 \left(1 + \frac{s}{20}\right)^3 \left(1 + \frac{s}{50}\right)^3 \left(1 + \frac{s}{100}\right)^{15}}{s^2 \left(1 + \frac{s}{100}\right)^3 \left(1 + \frac{s}{200}\right)^6 \left(1 + \frac{s}{500}\right)^6}$$

Now, at $\omega = 2$, $M_{db} = 0$ dB.

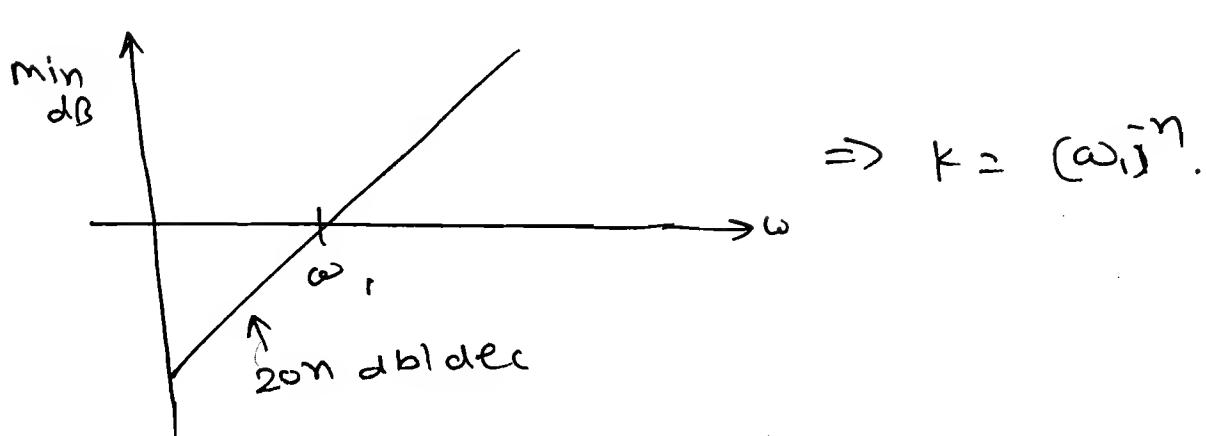

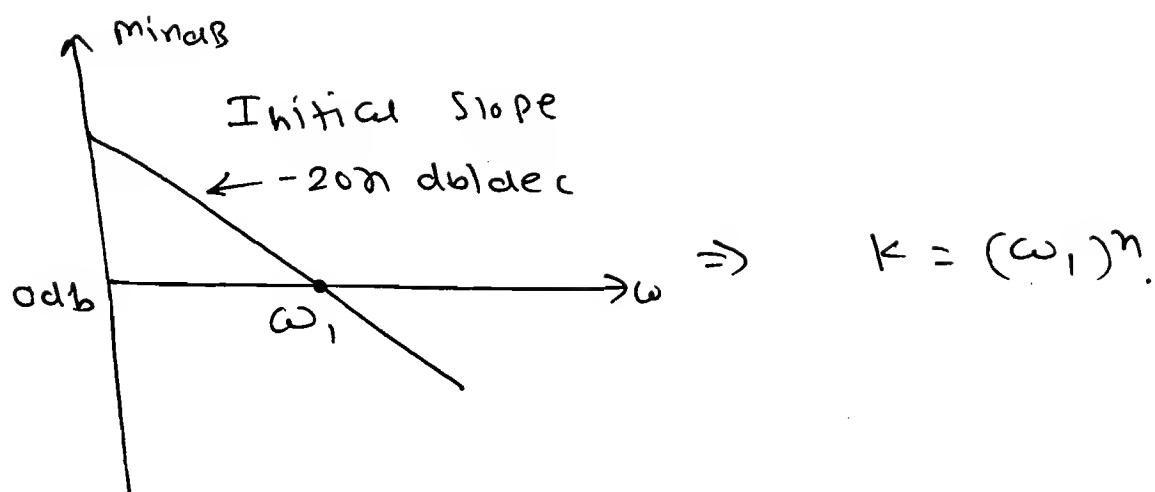

$$\therefore 0 \text{ dB} = 20 \log_{10} \left(\frac{k}{\omega^2} \right).$$

$$\Rightarrow 0 \text{ dB} = 20 \log_{10} k - 40 \log \omega. \Big|_{\omega=2}$$

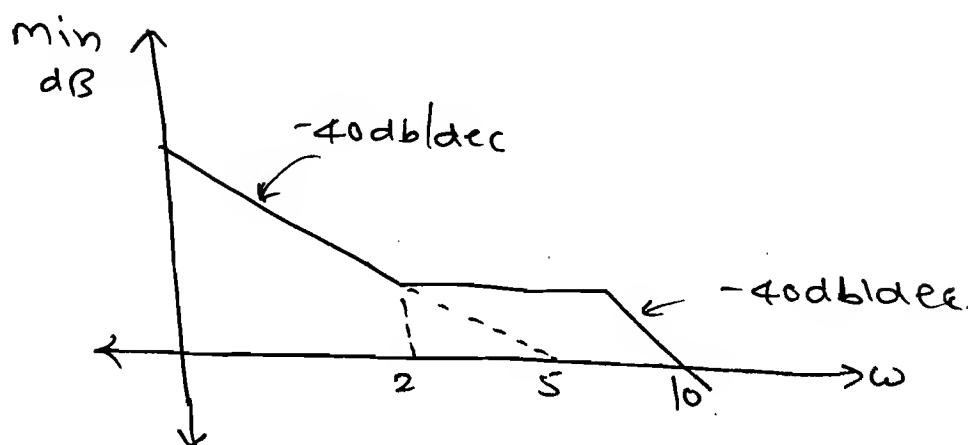

$$20 \log k = 40 \log 2$$

$$\log k = \log 2^2$$

$$\boxed{k = 4}$$

(a) Find TF.

Sol: Initial Slope = $-40 \text{ dB/dec} = -2 \times 20 \text{ dB/dec}$

$m = ?$

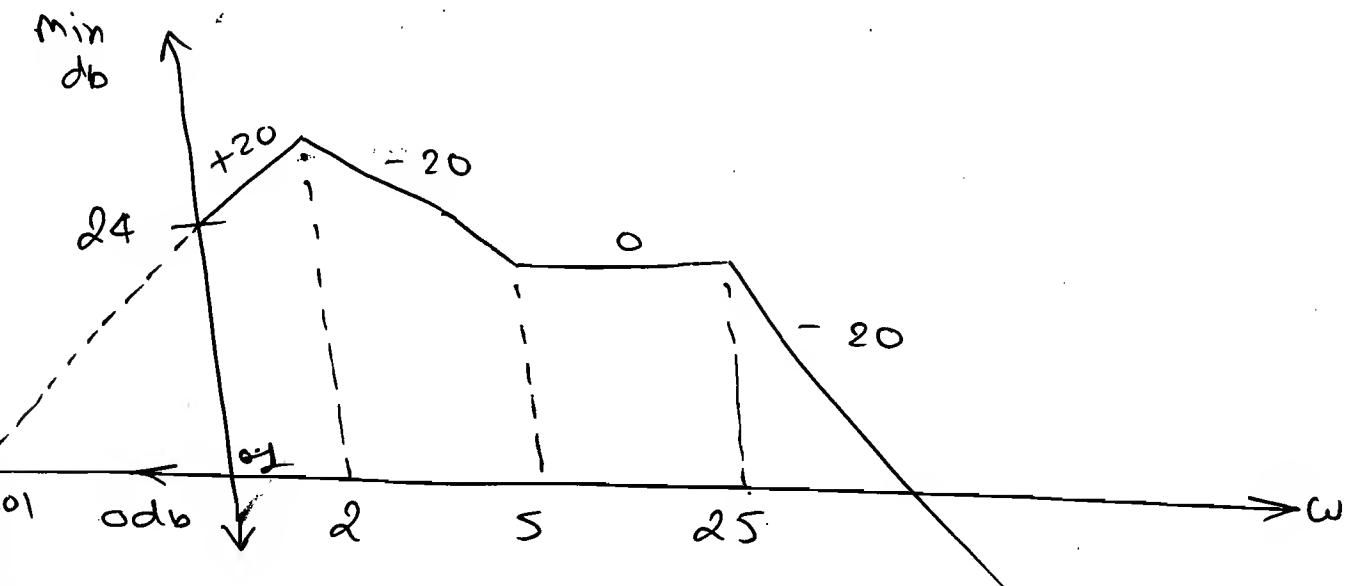

\Rightarrow Initial slope crosses the ω axis at $\omega = 5 \text{ rad/sec. } \& n = 2$

$\Rightarrow K = (\omega)^n$

$K = (5)^2 = 25.$

$$\Rightarrow TF = \frac{25 (1 + s/2)^2}{s^2 (1 + s/10)^2}$$

(a) Find the TF.

Soln:

$$G_H(s) = \frac{K s^2 \times (1 + s/5)}{(1 + s/2)^2 (1 + s/25)}$$

$$\text{Now } \left. \text{Min db} \right|_{\omega=0.1} = 24 \text{ db}$$

$$\therefore 24 = 20 \log (K_f \cdot \omega)$$

$$\Rightarrow 24 = 20 \log_{10} K + 20 \log (\omega)$$

$$24 + 20 = 20 \log_{10} K$$

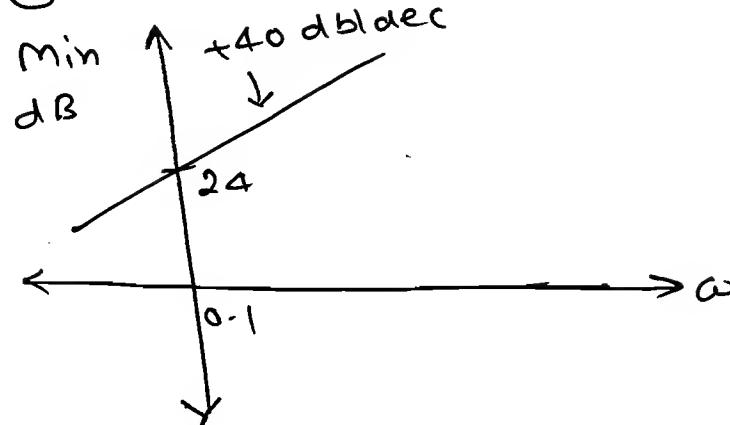

$$\log_{10} K = 1.2$$

$$\Rightarrow K = 15.85$$

(Q)

①

Find K value for the following Bode plots:

Soln:

$$G_H(s) = \frac{K \cdot s^2}{s^2}$$

At $\omega = 0.1$, $M_{dB} = 24$ dB.

$$\Rightarrow 24 = 20 \log(K \cdot \omega^2)$$

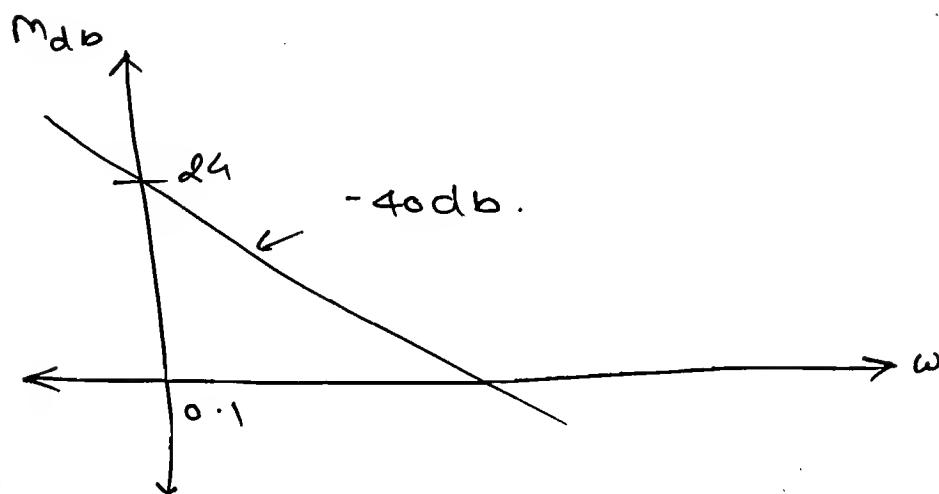

$$\Rightarrow 24 = 20 \log K + 40 \log(0.1)$$

$$24 = 20 \log K - 40$$

$$64 = 20 \log K$$

$$\Rightarrow K = 1584.89$$

②

Soln:

$$G_H(s) = \frac{K}{s^2}$$

$$M_{dB} \Big|_{\omega=0.1} = 24 \text{ dB}$$

$$\Rightarrow 24 = 20 \log k - 40 \log(\omega).$$

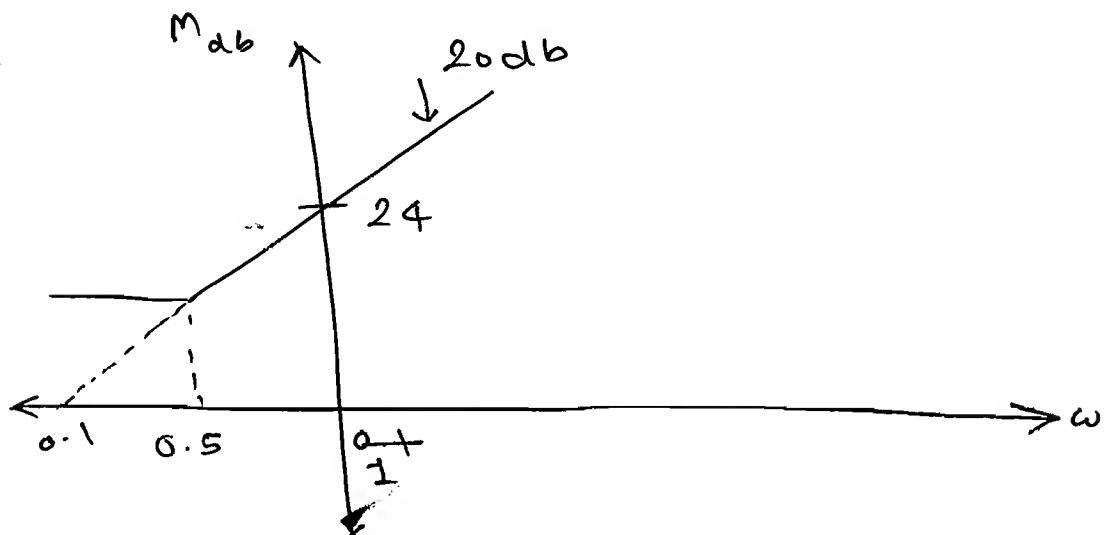

$$\therefore 24 = 20 \log k - 40 \log(0.1).$$

$$\therefore 24 - 40 = 20 \log k$$

$$\therefore \log k = -\frac{16}{20}.$$

$$\Rightarrow k = 0.15848$$

3

Soln:
=

$$G_{HCS} = \frac{k \times (1 + S/0.5)}{1}$$

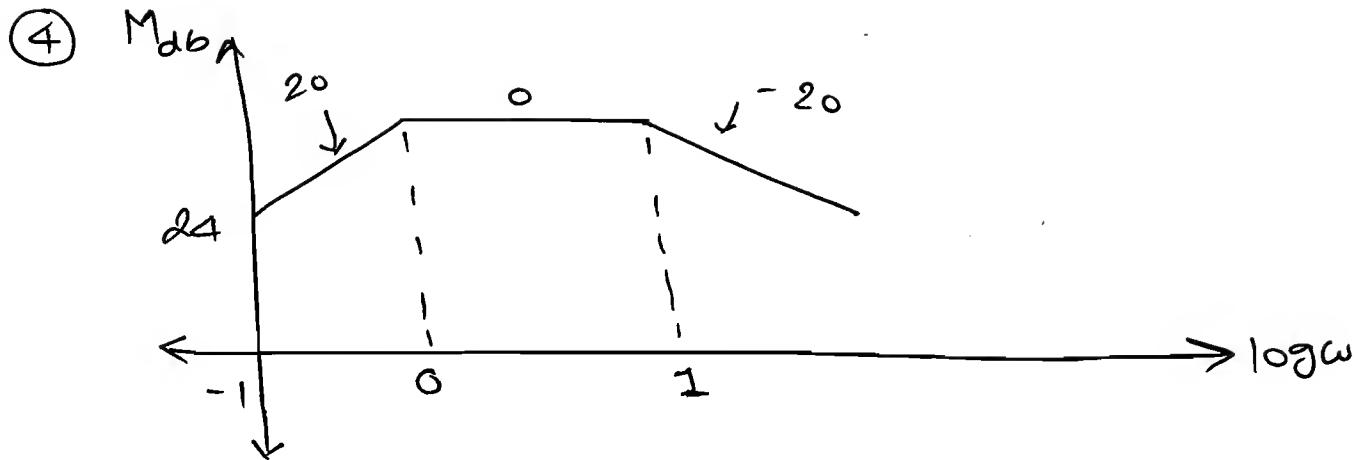

$$\text{ext} \rightarrow M_{db} \Big|_{\omega=0.5} = 24 \text{ db.}$$

$$\therefore 24 = 20 \log k + 20 \log \left(\sqrt{1 + (\omega/0.5)^2} \right).$$

$$\therefore 24 = 20 \log_{10} k + 20 \log \sqrt{1+4}$$

$$\therefore 24 - 6.889 = 20 \log_{10} k$$

$$\Rightarrow k = 7.0876$$

Soln:

$$16 \log K + 20 \approx 20 \quad \log \omega = -1 \Rightarrow \omega = 0.1$$

$$16 \log K + 20 \approx 10 \quad \log \omega = 0 \Rightarrow \omega = 1.$$

$$16 \log K + 20 \approx 0 \quad \log \omega = 1 \Rightarrow \omega = 10.$$

So, $G_{HCS} = \frac{KS}{\left(\frac{s}{1} + 1\right)^1 \left(\frac{s}{10} + 1\right)^1}$

Now, $M_{dB} \Big|_{\omega=0.1} = 24.$

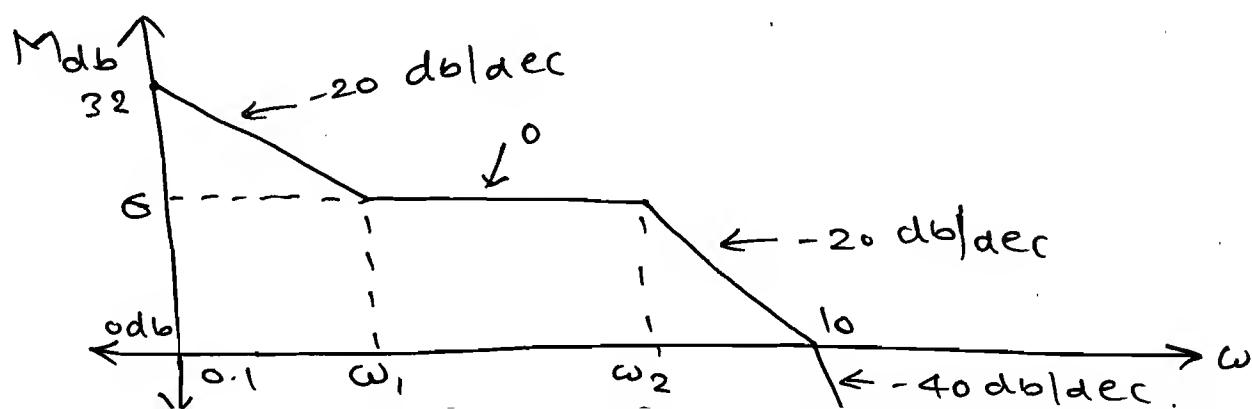

$$\therefore 24 = 20 \log K + 20 \log \omega - 20 \log \sqrt{\omega^2 + 1} \\ - 20 \log \sqrt{\frac{\omega^2}{100} + 1}.$$

$$\therefore 24 = 20 \log K - 20$$

$$\frac{24 + 20}{20} = \log_{10} K$$

$$\Rightarrow \boxed{K = 158.487}$$

Find the ω_1, ω_2, TF

$$\underline{\text{Soln:}} \rightarrow \text{Slope} = \frac{dM}{d\log \omega}.$$

$$\therefore -20 \text{ db/dec} = \frac{6-0}{\log \omega_1 - \log \omega_2 - \log 10}.$$

$$\therefore -20 = \frac{6}{\log \omega_2 - 1}$$

$$\therefore -20 \log \omega_2 + 20 = 6$$

$$20 \log \omega_2 = +14$$

$$\log \omega_2 = 14/20$$

$$\Rightarrow \boxed{\omega_2 = 5 \text{ rad/sec}}$$

$$\rightarrow \text{Slope} = \frac{dM}{d\log \omega}$$

$$\therefore -20 = \frac{32-6}{\log 0.1 - \log \omega_1}$$

$$\therefore -20 = \frac{26}{-1 - \log \omega_1}$$

$$\therefore 20 + 20 \log \omega_1 = 26.$$

$$20 \log \omega_1 = 6.$$

$$\boxed{\omega_1 = 2 \text{ rad/sec}}$$

$$\Rightarrow \text{TF } G(s) = \frac{K (1+s/2)}{s (1+s/5) (1)(1+s/10)}$$

$$M_{db}|_{\omega=0.1} = 32.$$

$$\Rightarrow 32 = 20 \log k - 20 \log (0.1).$$

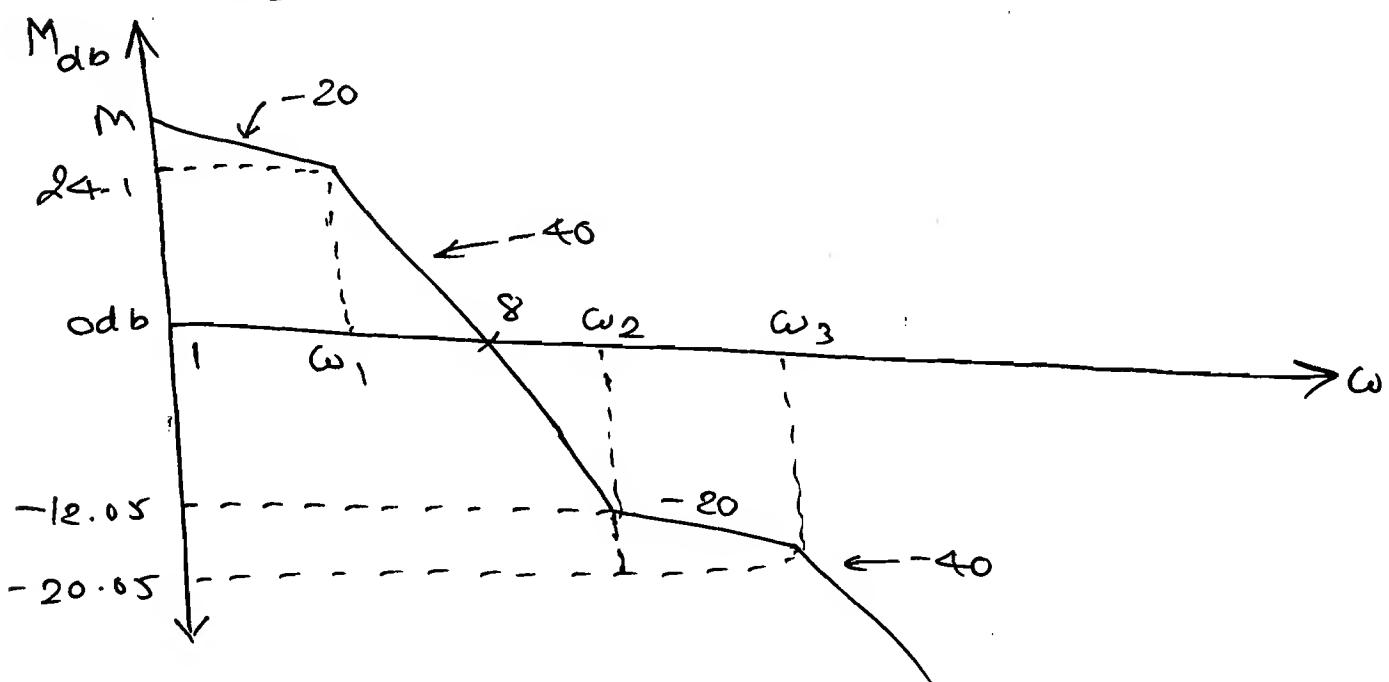

$$\therefore \frac{32 - 20}{20} = \log_{10} K$$

$$\Rightarrow k = 3.98 \approx 4.$$

So, TF

$$G(s) = \frac{4(1 + s\omega_2)}{s(1 + s\omega_5)(1 + s\omega_{10})}$$

* [a] Find the Magnitude M , ω_1 , ω_2 and ω_3 .

Soln:

$$\text{Slope} = \frac{dM}{\log_{10} \omega}$$

$$\therefore +40 = \frac{+12.05 - 0}{\log \omega_2 - \log 1}$$

$$\therefore +40 \log \omega_2 - 40 \log 1 = 12.05$$

$$40 \log \omega_2 = 48.17$$

$$\Rightarrow \omega_2 = 15.848$$

$$\omega_2 \approx 16 \text{ rad/sec}$$

$$\Rightarrow \text{Slope} = \frac{dM}{d\log \omega}$$

$$\Rightarrow -20 = \frac{24.1 - 0}{\log \omega_1 - \log 8}$$

$$\therefore -20 \log \omega_1 + 20 \log 8 = 24.1.$$

$$20 \log \omega_1 = 12.12$$

$$\Rightarrow \boxed{\omega_1 = 2 \text{ rad/sec}}$$

$$\Rightarrow \text{Slope} = \frac{dM}{d\log \omega}$$

$$\Rightarrow -20 = \frac{M - 24.1}{\log \omega_1 - \log \omega_2}$$

$$20 + 20 \log \omega_1 = M - 24.1$$

$$20 + 20 \log 2 = M - 24.1$$

$$\Rightarrow \text{Ans} \boxed{M = 30.1 \text{ dB}}$$

$$\Rightarrow \text{Slope} = \frac{dM}{d\log \omega}$$

$$\therefore -20 = \frac{-12.05 + 20.05}{\log \omega_2 - \log \omega_3}$$

$$\therefore -20 \log \omega_2 + 20 \log \omega_3 = 8.$$

$$20 \log \omega_3 = 39.02 / 1.$$

$$\Rightarrow \boxed{\omega_3 \approx 40 \text{ rad/sec}}$$

Now,

$$TF \quad G_{HCS} = \frac{k(1 + S/\zeta_1)}{S(1 + \frac{\zeta}{2})(1 + S/\zeta_0)}$$

$$M_{db}|_{\omega=1} = 30.1 \text{ db.}$$

$$\therefore 30.1 \text{ db} = 20 \log k - 20 \log (1).$$

$$\Rightarrow 20 \log k = 30.1.$$

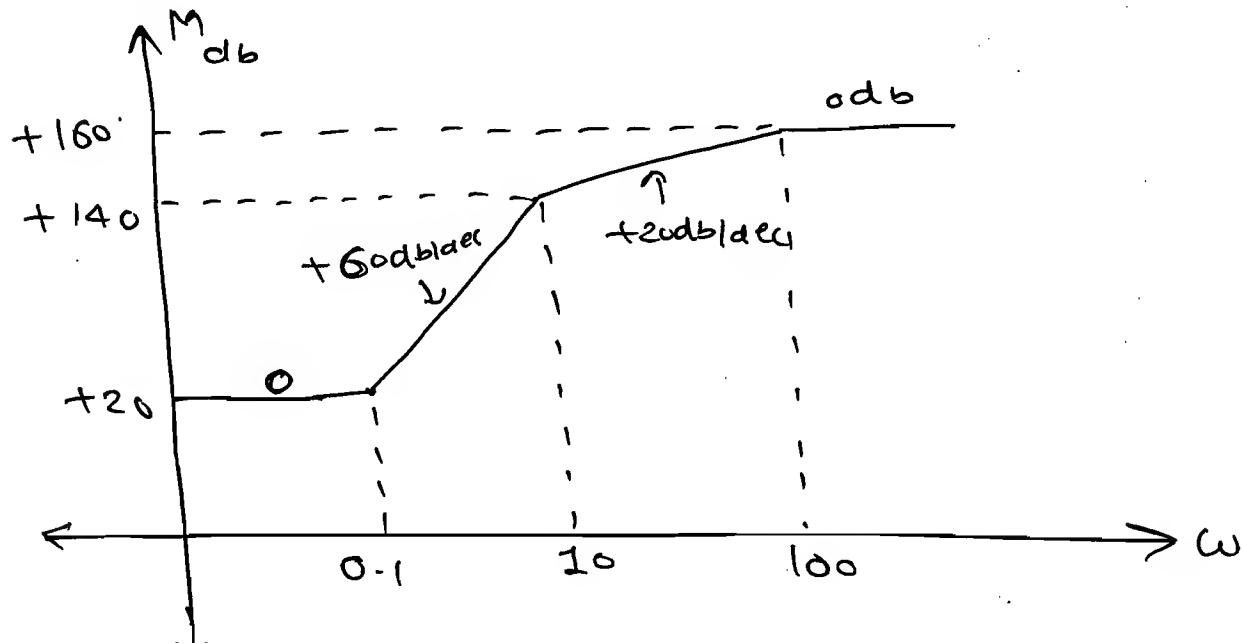

$$\log k = \frac{30.1}{20}$$

$$\Rightarrow k \approx 32$$

\Rightarrow

$$G_{HCS} = \frac{32(1 + \frac{S}{16})}{S(1 + \zeta_1)(1 + S/\zeta_0)}$$

Q The Asymptotic Approximation of the M_{db} vs ω plot of a minimum phase system is shown in figure its TF is — ?

Solⁿ: Slope-1 \Rightarrow 0. db/dec.

$$\text{Slope-2} \Rightarrow \frac{140 - 20}{-\log 0.1 + \log 10} = \frac{120}{+1+1} = +60 \text{ db/dec}$$

$$\text{Slope-3} \Rightarrow \frac{dM}{\log \omega} = \frac{160 - 140}{\log 100 - \log 10} = \frac{20}{2-1} = 20 \text{ db/dec.}$$

So, TF $G_{HCS} = \frac{K \left(1 + \frac{S}{0.1}\right)^3}{\left(1 + \frac{S}{10}\right)^2 \left(1 + \frac{S}{100}\right)}$

$$\text{M}_{\text{indB}} \Big|_{\omega=0} = 20.$$

$$\therefore 20 = 20 \log K + 60 \log \sqrt{1 + \left(\frac{0}{0.1}\right)^2}.$$

$$\therefore 20 = 20 \log K + 60 \times \cancel{\log \sqrt{1 + \left(\frac{0}{0.1}\right)^2}}.$$

$$\underline{20 - 9.63 = 20 \log K}$$

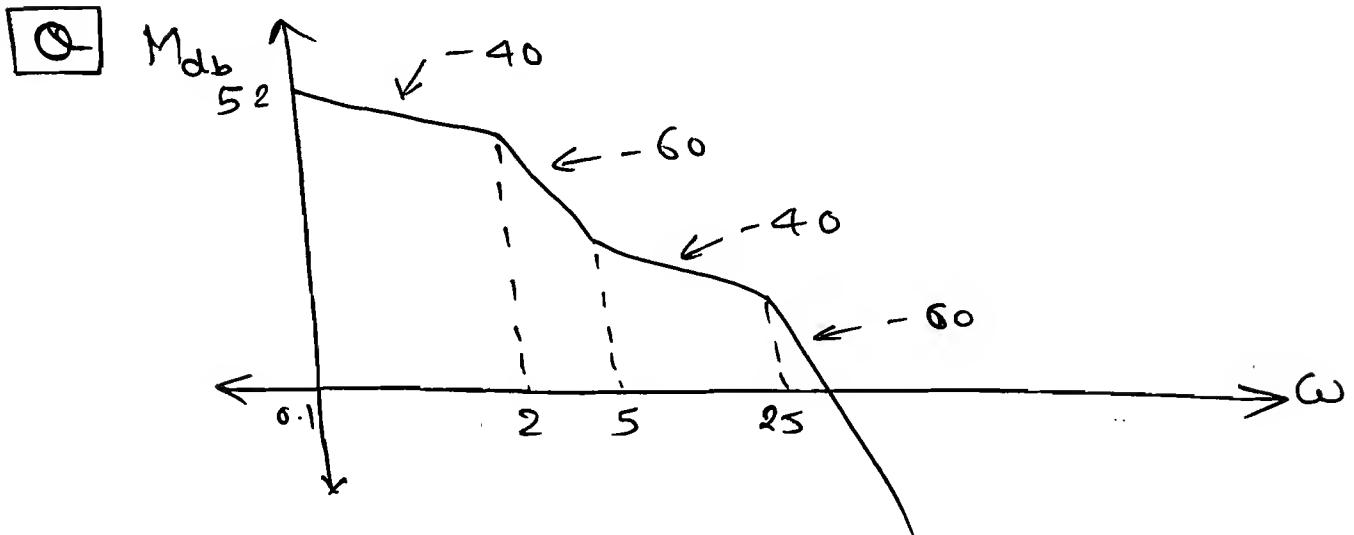

$$20 = 20 \log K$$

$$\therefore \Rightarrow \boxed{K = 10}$$

$$\therefore G_{HCS} = \frac{10 \left(1 + \frac{S}{0.1}\right)^3}{\left(1 + \frac{S}{10}\right)^2 \left(1 + \frac{S}{100}\right)}.$$

$$\therefore G_{HCS} = \frac{10 \times \left(\frac{1}{0.1}\right)^3 (S+0.1)^3 \times 10^2 \times 10^0}{(S+10)(S+100)}.$$

$$\Rightarrow G_H(s) = \frac{10^8 (s + 0.1)^3}{(s+10)^2 (s+100)}$$

Soln:

$$TF = G_H(s) = \frac{k (1+s/5)}{s^2 (1+s/2)^2 (1+s/25)^2}$$

$$\text{Now, } M_{db} \Big|_{\omega=0.1} = 52 \text{ db}$$

$$\Rightarrow 52 = 20 \log k - 40 \log \omega.$$

$$\therefore 52 = 20 \log k - 40 \log (0.1).$$

$$\frac{12}{20} = \log k.$$

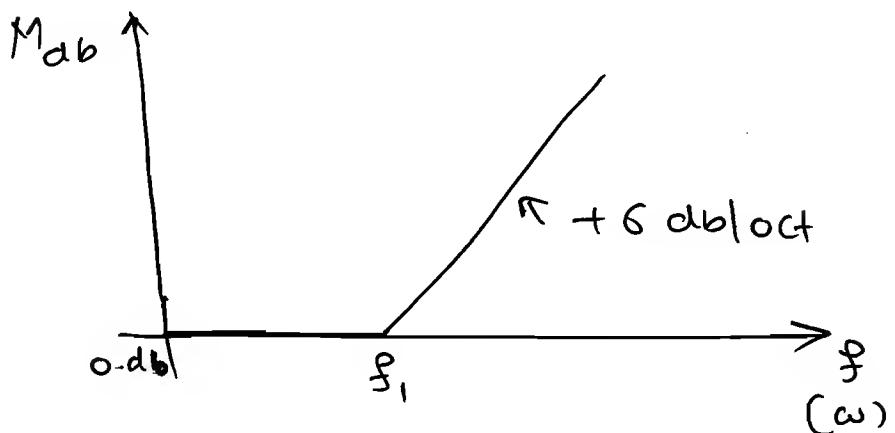

$$\therefore \Rightarrow k = 4.$$

$$\Rightarrow TF = \frac{4 (1+s/5)}{s^2 (1+s/2)^2 (1+s/25)^2}$$

$$= \frac{4}{s} \frac{s^2 \times 25 (s+5)}{s^2 (s+2) (s+25)}$$

$$\Rightarrow \boxed{TF = \frac{40(s+5)}{s^2(s+2)(s+25)}}.$$

Q) Find the TF

Soln:

$$G_H(s) = K \left(1 + \frac{s}{\tau_1} \right).$$

$$G_H(j\omega) = K \left(1 + \frac{j2\pi f_1}{2\pi f_1} \right)$$

$$G_H(f) = K \left(1 + j \frac{f}{f_1} \right).$$

$$\text{Here } M_{\text{indB}}|_{\omega=0.1} = 0 \text{ db}$$

$$\Rightarrow K = 1.$$

$$\therefore \boxed{G_H(f) = \left(1 + j \frac{f}{f_1} \right)}.$$

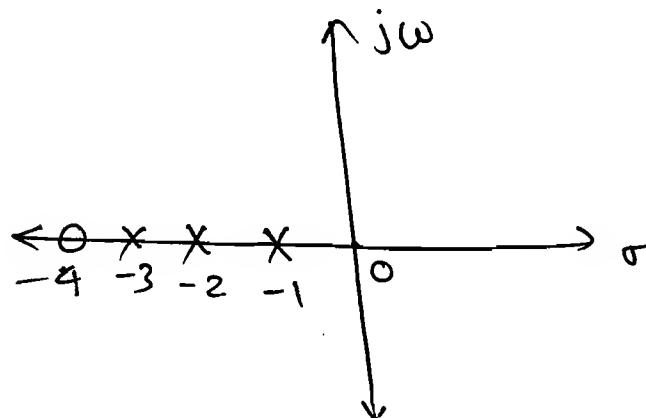

* Classification of System :-

1) Minimum Phase System :-

⇒ A system in which all the finite poles and finite zeros lies in the left- of s-plane then it is called minimum phase system.

⇒ The minimum phase sm system gives the angle $\leq 90^\circ$.

e.g.:

$$MPS = \frac{(s+4)}{(s+2)(s+3)(s+1)}$$

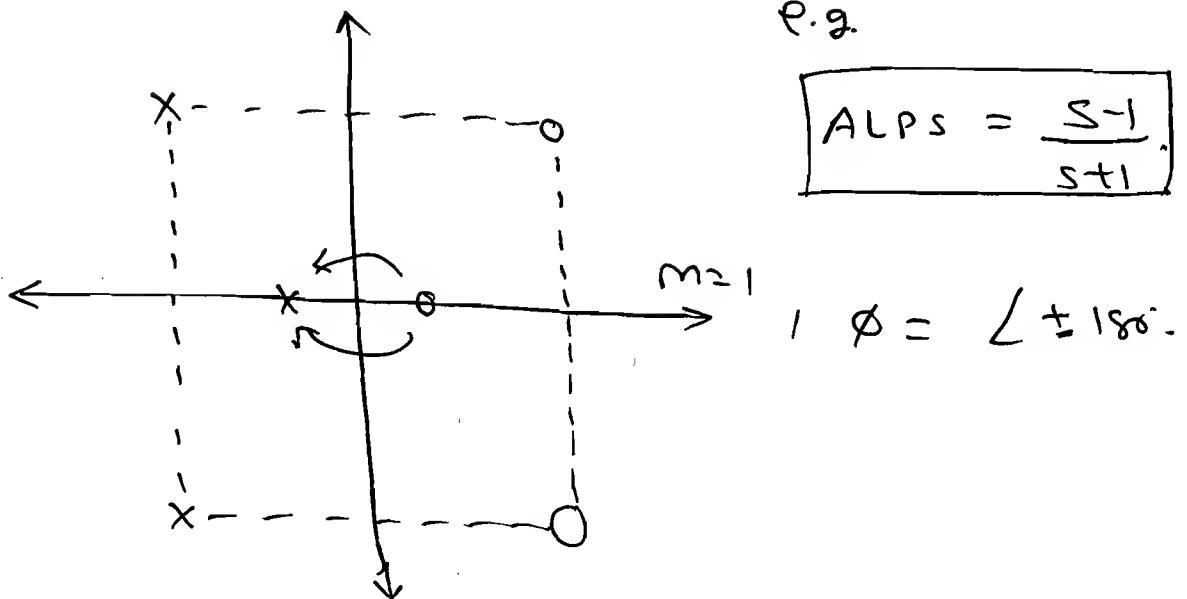

2) All Pass System :-

⇒ A system in which all poles are lies in the left of s-plane and all the zeros are lies in Right of the s-plane which are symmetrical about imaginary axis then it is called All pass system.

⇒ All pass system gives Magnitude of

'I', and the Phase angle varies b/w $\pm 180^\circ$.

\Rightarrow

e.g.

$$\text{ALPS} = \frac{S-1}{S+1}$$

$$1/\phi = \angle \pm 180^\circ$$

\Rightarrow Non-Minimum Phase System:

\Rightarrow A system in which one (or) more zero (or) one (∞) more pole (or) Both poles and zeros lies in the Right of the s-plane then it is called Non-minimum phase system.

\Rightarrow The NMP gives the more -ve angle at $\omega = \infty$.

\Rightarrow The NMP system may be Unstable.

e.g. NmPS =
$$\frac{(S+1)(S-2)}{(S+3)(S+5)}$$

$$NMPS = \left[\frac{(S+1)(S+2)}{(S+3)(S+5)} \right] \times \left(\frac{S-2}{S+2} \right)$$

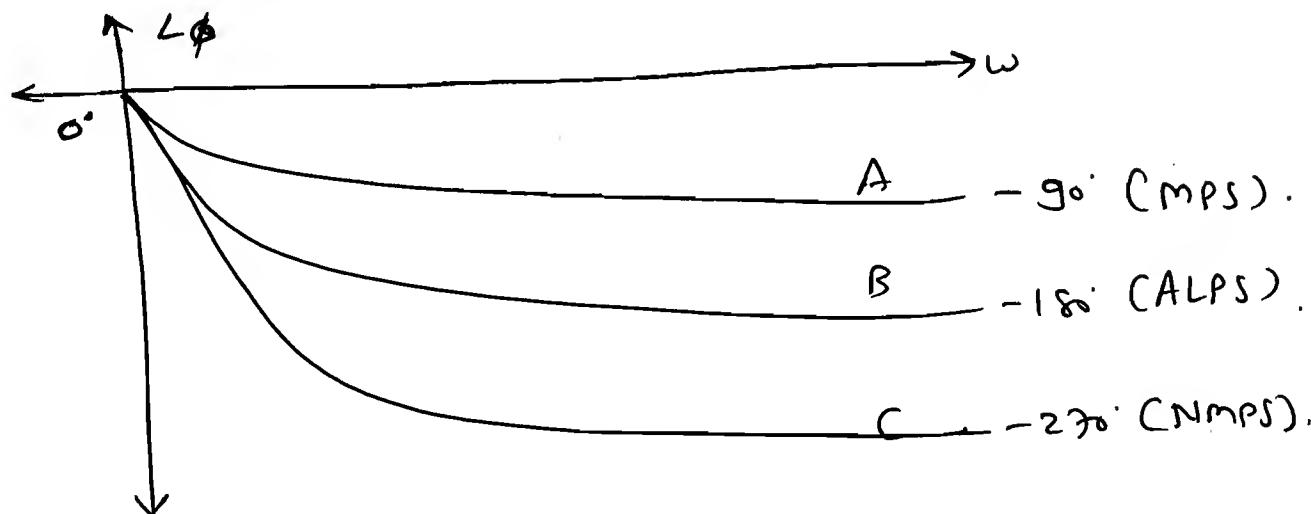

↓
 MPS ↓
 APS

$$\Rightarrow NMPS = MPS \times APS.$$

\Rightarrow NMPS is nothing but the Product of MPS and ALPS.

$$\Rightarrow \phi_{NMPS} = \phi_{MPS} + \phi_{ALPS}.$$

a) Identify the curves A, B, C in the given phase plot.

* Stability Condition:-

→ The stability conditions are to find the CL sys stability.

→ The CL system stability is given by Char. eqn i.e. $1 + G(s) \cdot H(s) = 0$.

then s is replaced by $j\omega$.

$$\rightarrow 1 + G(j\omega) \cdot H(j\omega) = 0.$$

$$G(j\omega) \cdot H(j\omega) = -1 + j0.$$

Mg $\rightarrow |G(j\omega) \cdot H(j\omega)| = 1$ in linear

$$M_{indB} = 20 \log 1 = 0 \text{ dB}.$$

$$M_{indB} = 0 \text{ dB}$$

\Rightarrow Gain Crossover frequency: ($\underline{\underline{\omega_{gc}}}$):

\Rightarrow The freq. at which the magnitude equal to '1' in linear and '0' in db is called Gain cross over freq.

\Rightarrow Write the phase angle.

$$\angle G(j\omega) = \phi = \angle -1 + j0 = -180^\circ.$$

\Rightarrow Phase Cross over frequency: ($\underline{\underline{\omega_{pc}}}$):

\Rightarrow The freq. at which the phase angle equal to -180° , is called phase cross over frequency. (ω_{pc}).

\Rightarrow Gain Margin:-

\Rightarrow Inverse of Magnitude at ω_{pc} gives the Gain Margin.

\Rightarrow The Gain Margin is the factor by which the system gain is increased to bring the system verge of the stability.

$$\therefore GM = \frac{1}{|G_H(j\omega)|} \Big|_{\omega=\omega_{pc}}$$

\Rightarrow

$$GM_{db} = -20 \log |G_H(j\omega)| \Big|_{\omega=\omega_{pc}}$$

\Rightarrow Phase Margin:

\Rightarrow It is an additional phase lag required to add to the system to bring the system at verge of the Stability.

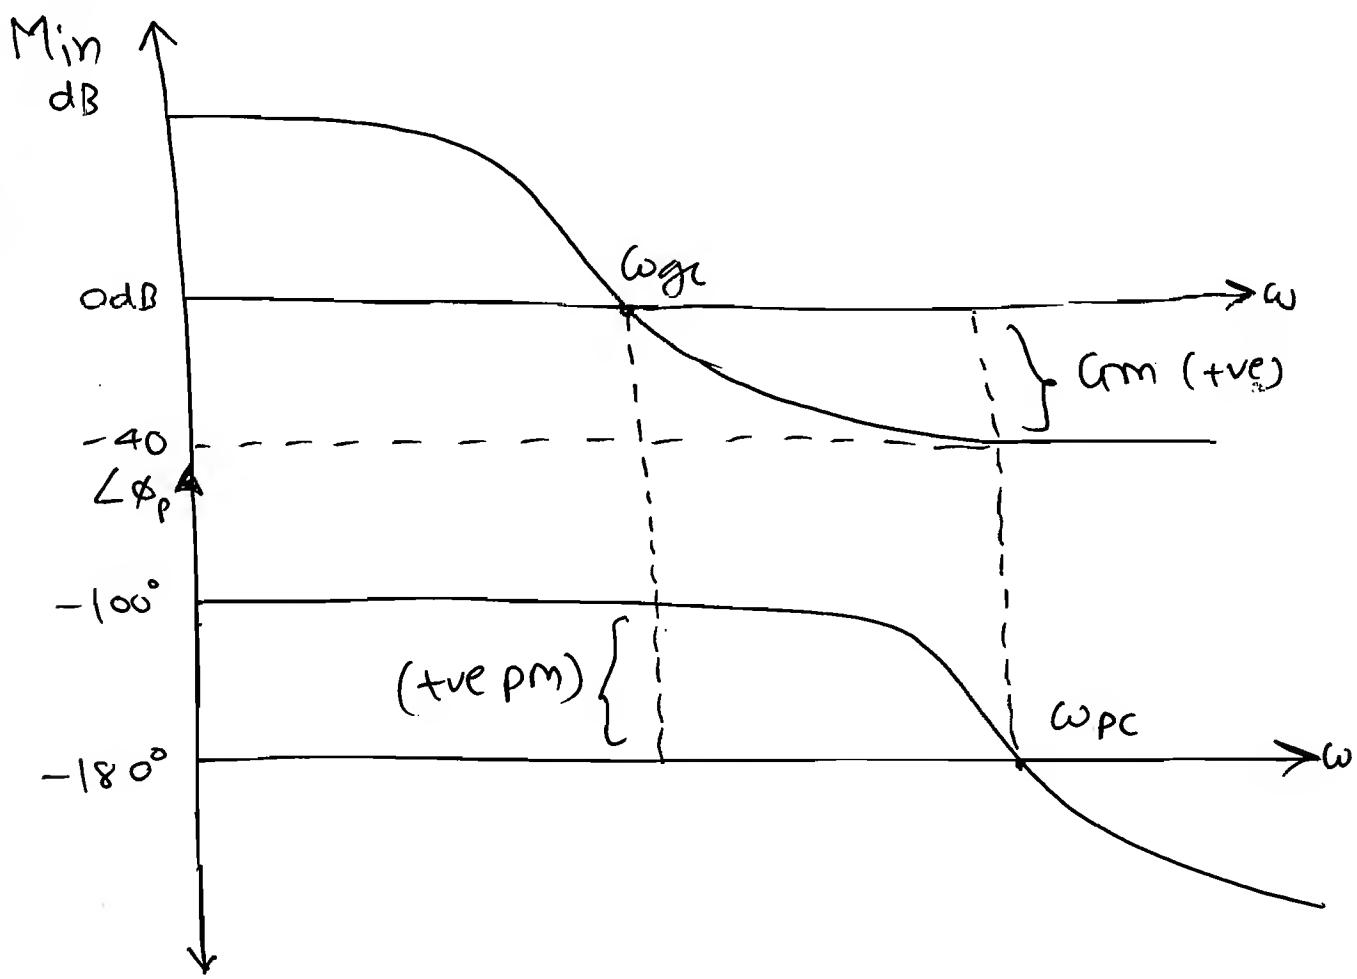

$$PM = 180^\circ + \angle G_H(j\omega) \Big|_{\omega=\omega_{ge}}$$

* $\Rightarrow \omega_{pc} > \omega_{ge} \rightarrow \textcircled{S} \quad \left\{ \begin{array}{l} \text{Gm} \left\{ \begin{array}{l} \rightarrow \text{tve in dB} \\ \rightarrow > 1 \text{ in } \textcircled{L} \end{array} \right\} \& \left\{ \text{PM tve} \right\} \end{array} \right.$

$\Rightarrow \omega_{pc} = \omega_{ge} \rightarrow \textcircled{M.S} \quad \left\{ \begin{array}{l} \text{Gm} \left\{ \begin{array}{l} \rightarrow 0 \text{ dB} \\ \rightarrow 1 \text{ in } \textcircled{L} \end{array} \right\} \& \left\{ \text{PM} = 0^\circ \right\} \end{array} \right.$

$\Rightarrow \omega_{pc} < \omega_{ge} \rightarrow \textcircled{U.S} \quad \left\{ \begin{array}{l} \text{Gm} \left\{ \begin{array}{l} \rightarrow -\text{ve in dB} \\ \rightarrow < 1 \text{ in } \textcircled{L} \end{array} \right\} \& \left\{ \text{PM -ve} \right\} \end{array} \right.$

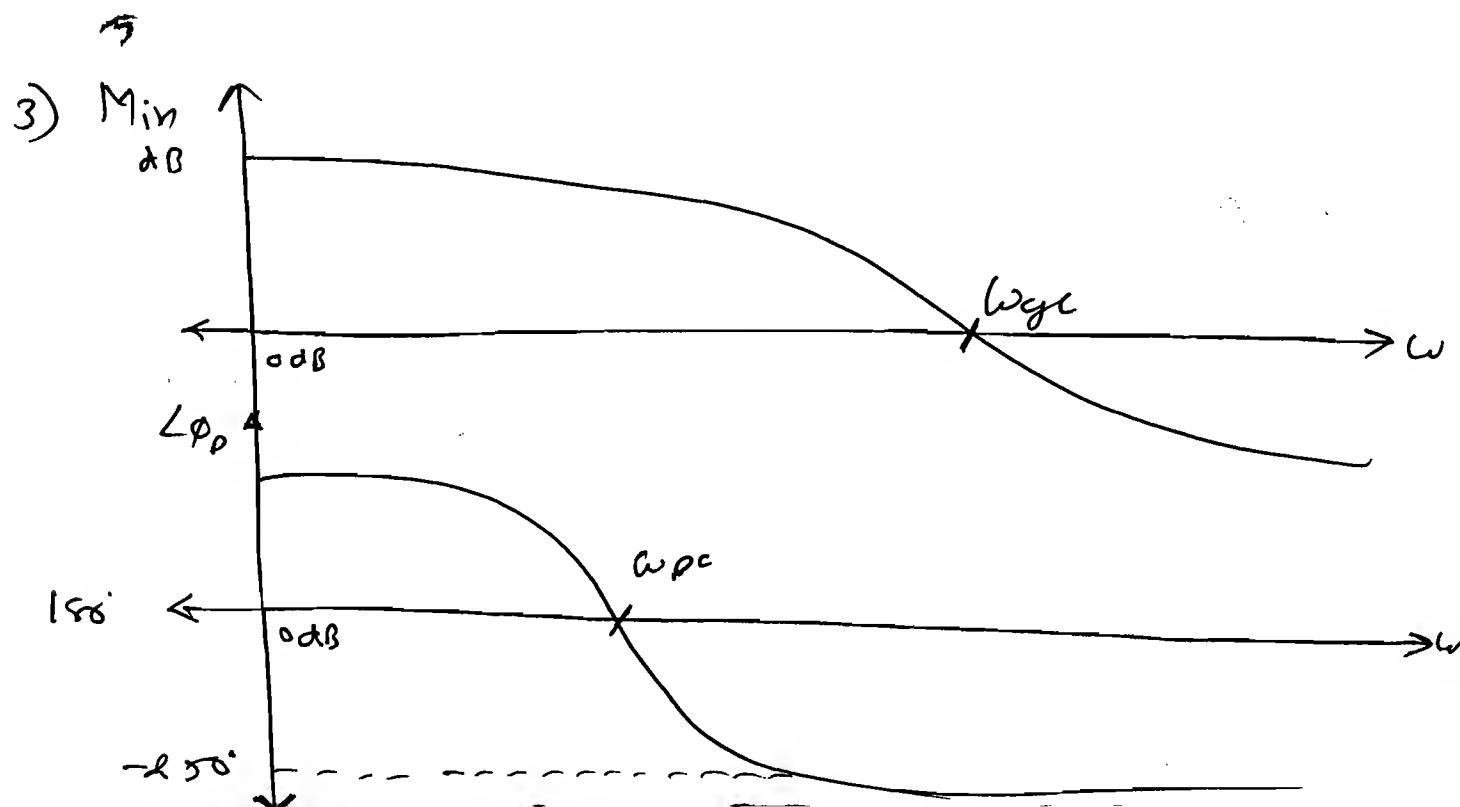

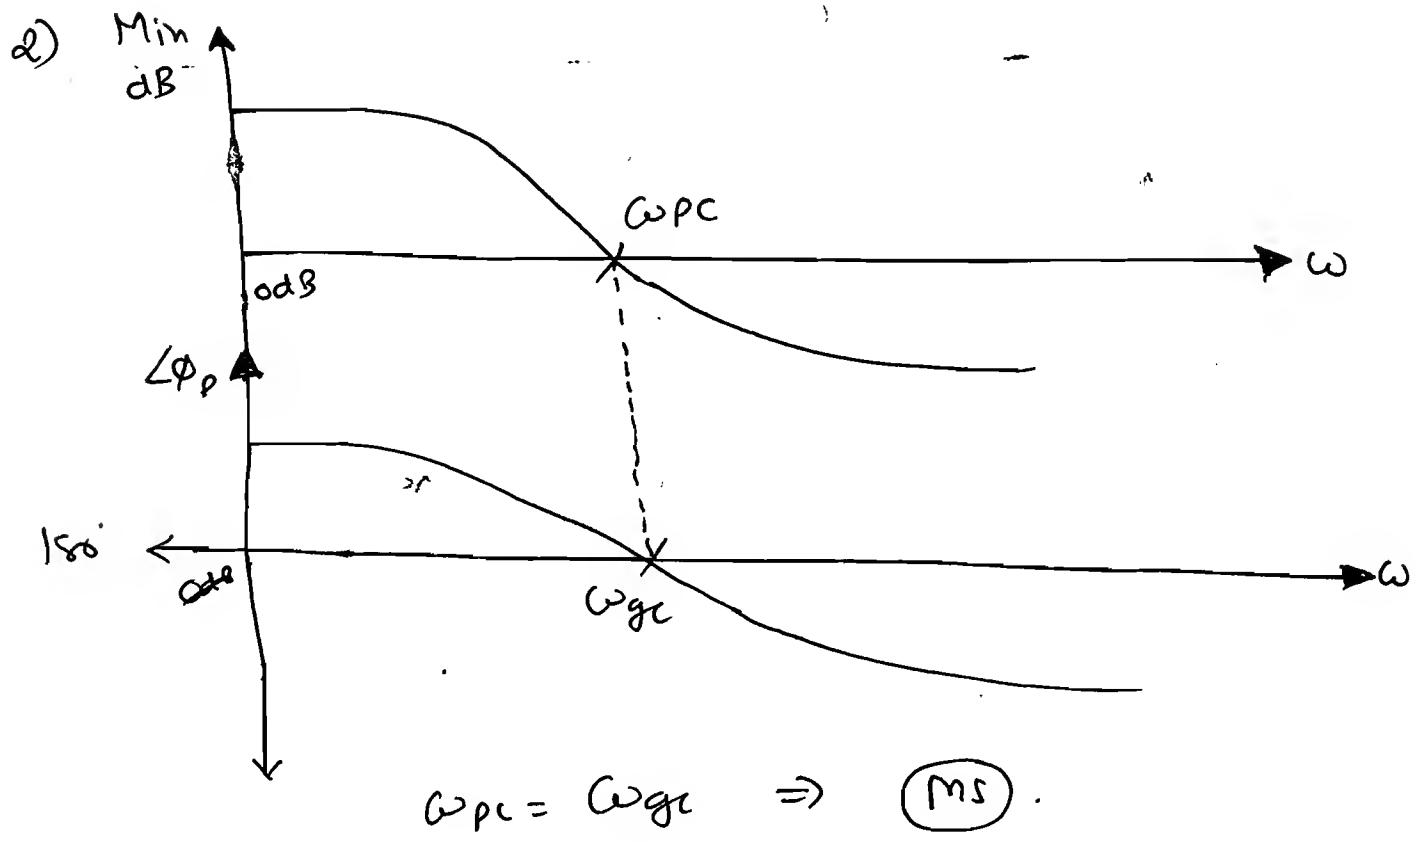

(Q) Identify the stability to the given Bode plot:

$$\Rightarrow \omega_{pc} > \omega_{ge} \Rightarrow \textcircled{S}$$

$$\Rightarrow GM = -(M_{indB}) \Big|_{\omega=\omega_{pc}} \\ = -(-40 \text{ dB}) \\ = +40 \text{ dB}$$

$$\Rightarrow \text{Phase margin } PM = 180^\circ + \angle G_H \Big|_{\omega=\omega_{gc}} \\ \therefore PM = 180^\circ - 100^\circ = +80^\circ > 0 \Rightarrow +ve.$$

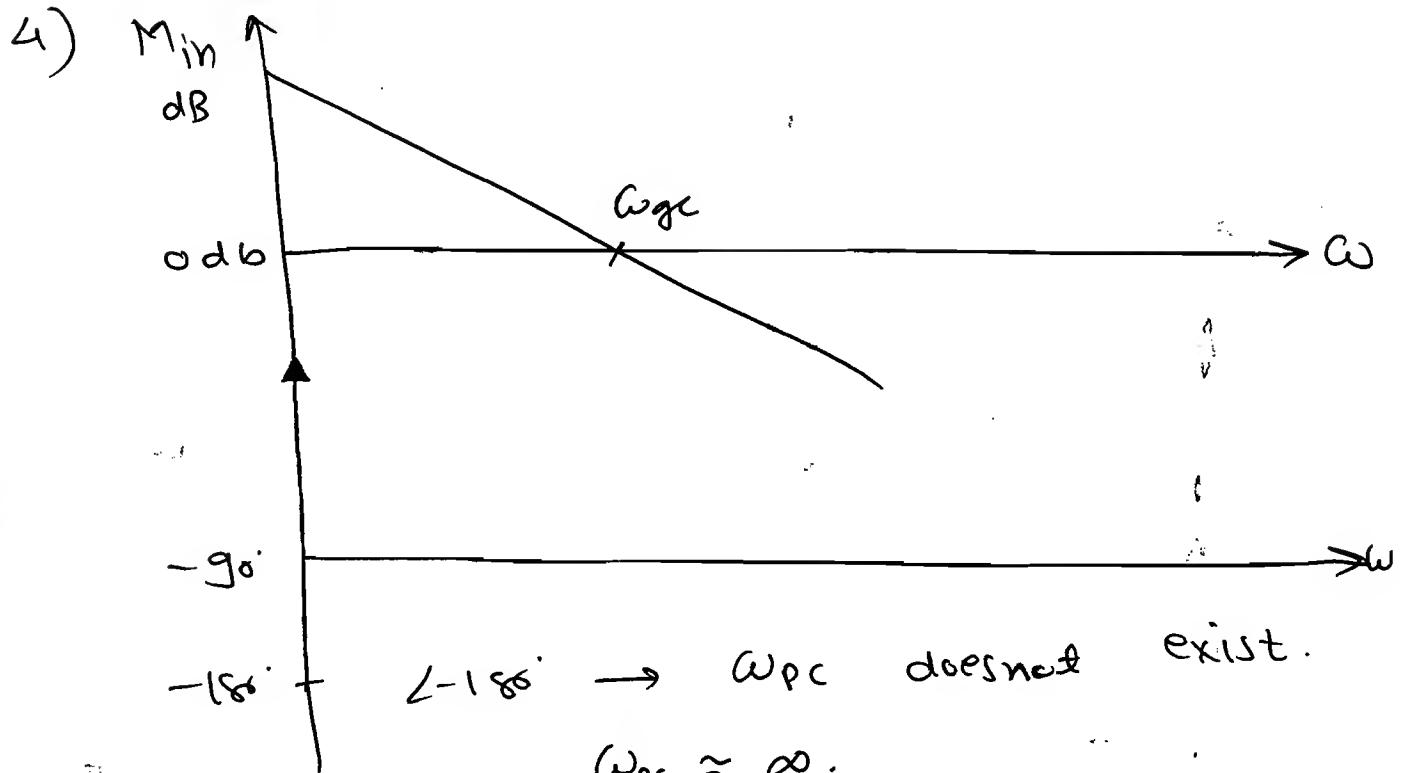

$$\Rightarrow \omega_{pc} < \omega_{gc} \rightarrow \textcircled{US}$$

$$GM = -50 \text{ (dB)}$$

$$PM = 180^\circ - 250^\circ$$

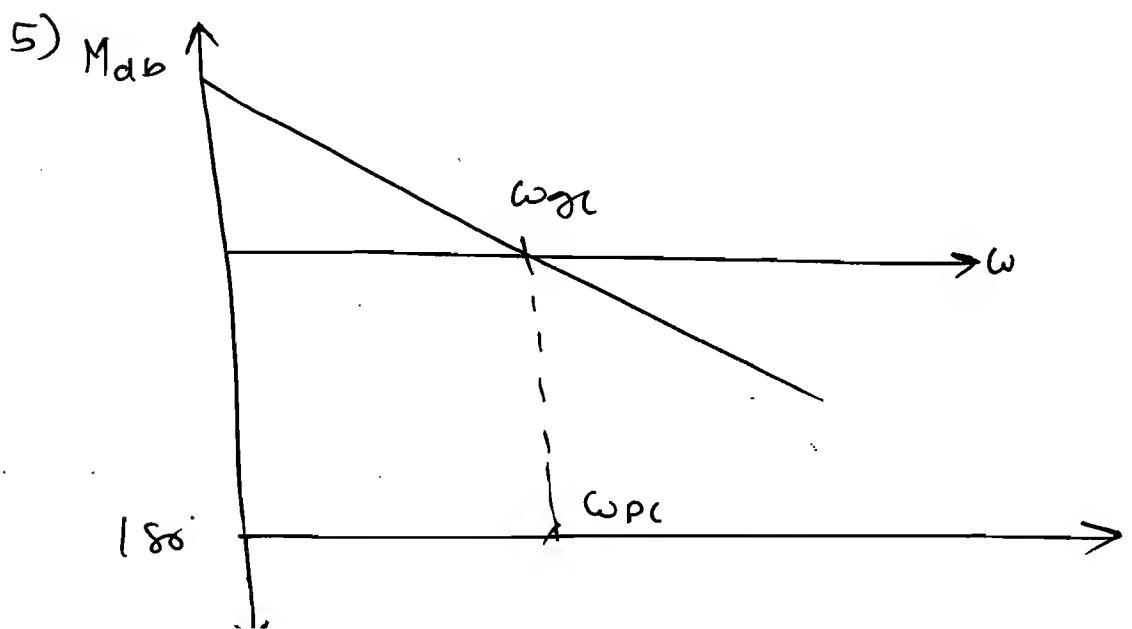

$$PM = -70^\circ \Rightarrow \textcircled{US}.$$

$$\omega_{pc} \gg \omega_{gc} \Rightarrow \textcircled{S}.$$

$$G(s) = \frac{1}{s}, \quad H(s) = 1.$$

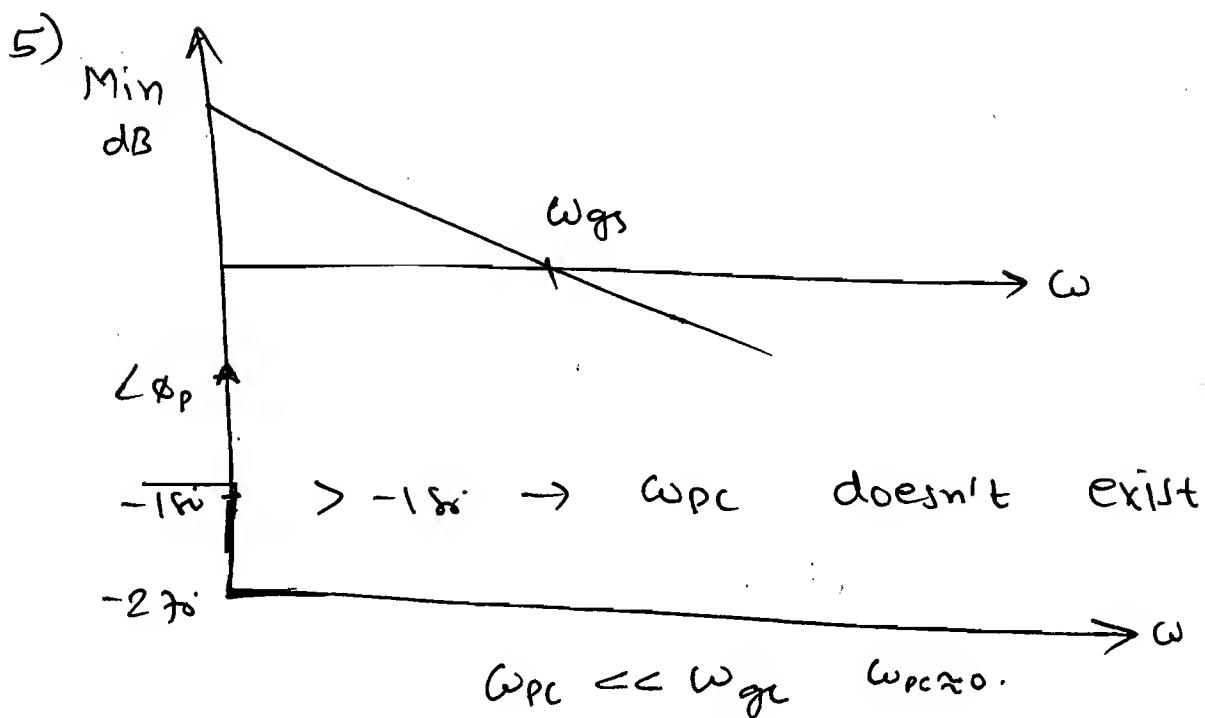

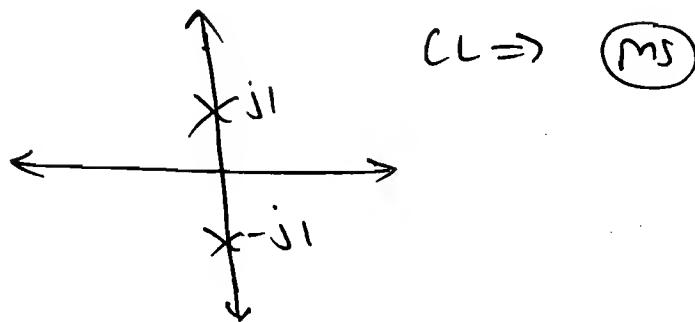

$$CLTF = \frac{1}{s+1}. \quad \times + CL \rightarrow \textcircled{S}.$$

$$\Rightarrow \omega_{pc} = 0 \text{ to } \infty$$

$$\omega_{pc} = \omega_{ge} \Rightarrow \textcircled{MS}$$

e.g. $G_{H(s)} = \frac{1}{s^2} \Rightarrow \text{CLTF} = \frac{1}{s^2 + 1}$.

e.g. $\rightarrow G(s) = \frac{1}{s^3}, \quad h(s) = 1$

$$\text{CLTF} = \frac{1}{s^3 + 1} \nearrow \text{terms missing} \Rightarrow \textcircled{US}$$

Note: Whenever the plot (or) TF maintains less (-ve) than 180° at all the freq. range then the system is stable because here

$\omega_{pc} \gg \omega_{ge}$. (Actually ω_{pc} does not exist but approximately infinity.)

⇒ Whenever the plot $\underline{\text{of}} \text{TF}$ maintains exactly 90° to -180° at all the freq. range then the system is Marginal Stable because here $\omega_{pc} = \omega_{ge}$.

⇒ Whenever the plot $\underline{\text{of}} \text{TF}$ maintains more (-ve) than 180° at all the freq. range then the system is unstable because here $\omega_{pc} < \omega_{ge}$.
(Actually ω_{pc} does not exist but approximately 0).

* Complex Bode Plot:

① n - Poles (complex):

$$\Rightarrow G_T(s) \cdot H(s) = \left(\frac{\omega_n^n}{s^2 + 2\zeta\omega_n s + \omega_n^2} \right)^n.$$

$$s \rightarrow j\omega$$

$$G_T(j\omega) = \left(\frac{\omega_n^n}{(j\omega)^2 + 2\zeta\omega_n j\omega + \omega_n^2} \right)^n.$$

$$G_{TF}(j\omega) = \left(\frac{\omega_n^2}{-\omega^2 + j2\xi\omega\omega_n + \omega_n^2} \right)^n$$

$$G_{TF}(j\omega) = \left(\frac{1}{1 - (\omega/\omega_n)^2 + j2\xi(\omega/\omega_n)} \right)^n$$

$$\therefore M = |G_{TF}(j\omega)| = \sqrt{\frac{1}{\left(1 - \left(\frac{\omega}{\omega_n}\right)^2\right)^2 + \left(2\xi\frac{\omega}{\omega_n}\right)^2}}^n$$

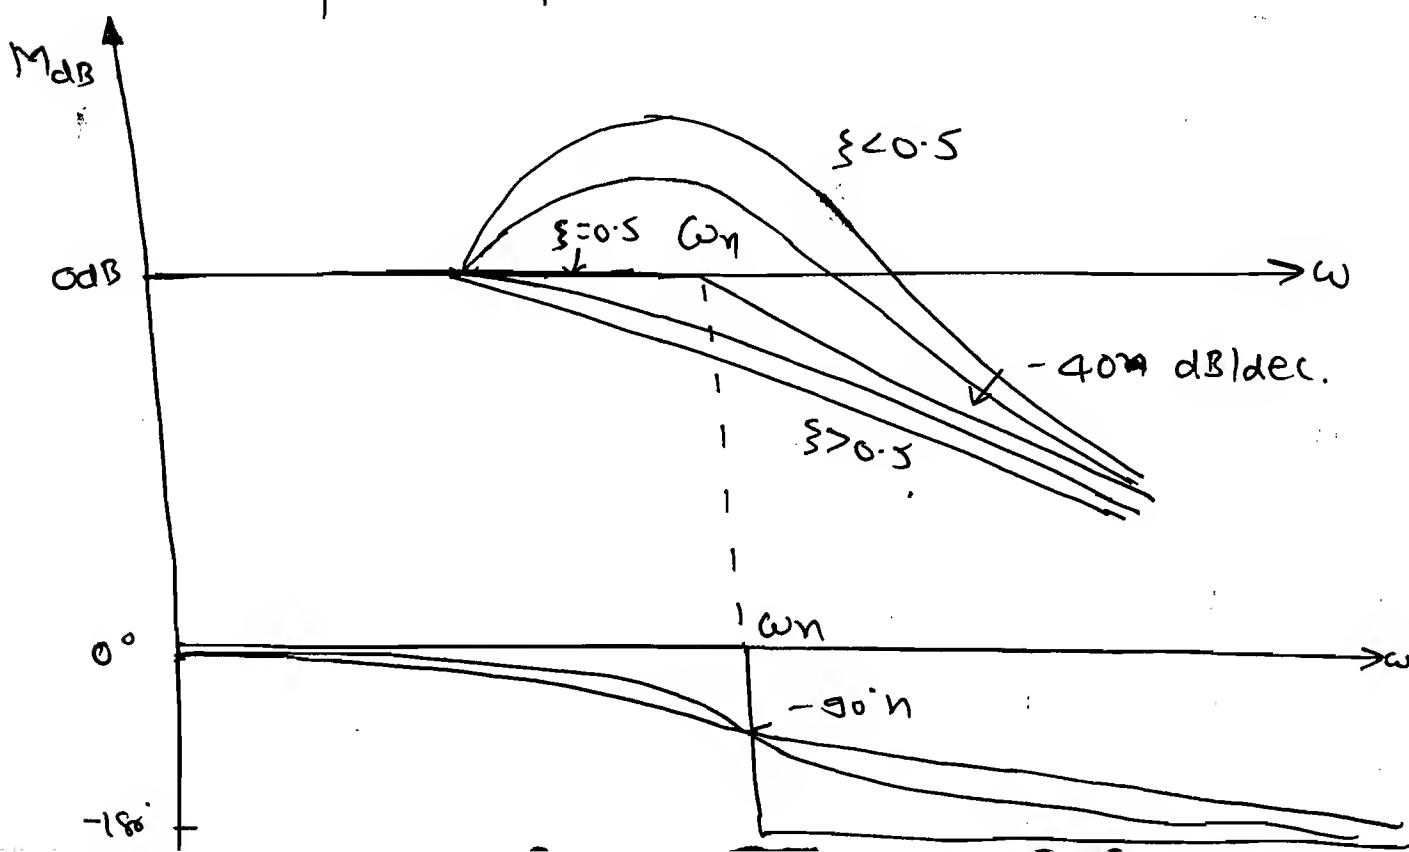

$$\therefore M_{\text{dB}} = -20 \log_{10} \sqrt{\left(1 - \left(\frac{\omega}{\omega_n}\right)^2\right)^2 + \left(2\xi\frac{\omega}{\omega_n}\right)^2}$$

actual

$$\phi_{\text{actual}} = -n \tan^{-1} \left[\frac{2\xi\omega/\omega_n}{1 - (\omega/\omega_n)^2} \right].$$

$\omega_n \rightarrow$ corner freq.

	s	ϕ
< CF	0 dB	0°
> CF	-40 dB/dec	-180°/n

\Rightarrow Correction at corner freq.

$$M_{\text{correction}} = -20 \log 25. \\ (\omega = \omega_n)$$

$$\phi_{\text{correction}} = -90^\circ. \\ (\omega = \omega_n)$$

\Rightarrow The correction at corner freq. depends on ξ in the Magnitude plot where in the phase plot the correction at corner freq. ~~from the~~ ^{is other} ~~correction~~ depends ~~on~~ ~~then~~ is constant other than corner freq. the correction depends on $\xi \omega_n$.

② n-complex zeros:

$$\Rightarrow G_H(s) = \left(\frac{s^2 + 2\xi \omega_n s + \omega_n^2}{\omega_n^2} \right)^n$$

$$s \rightarrow j\omega$$

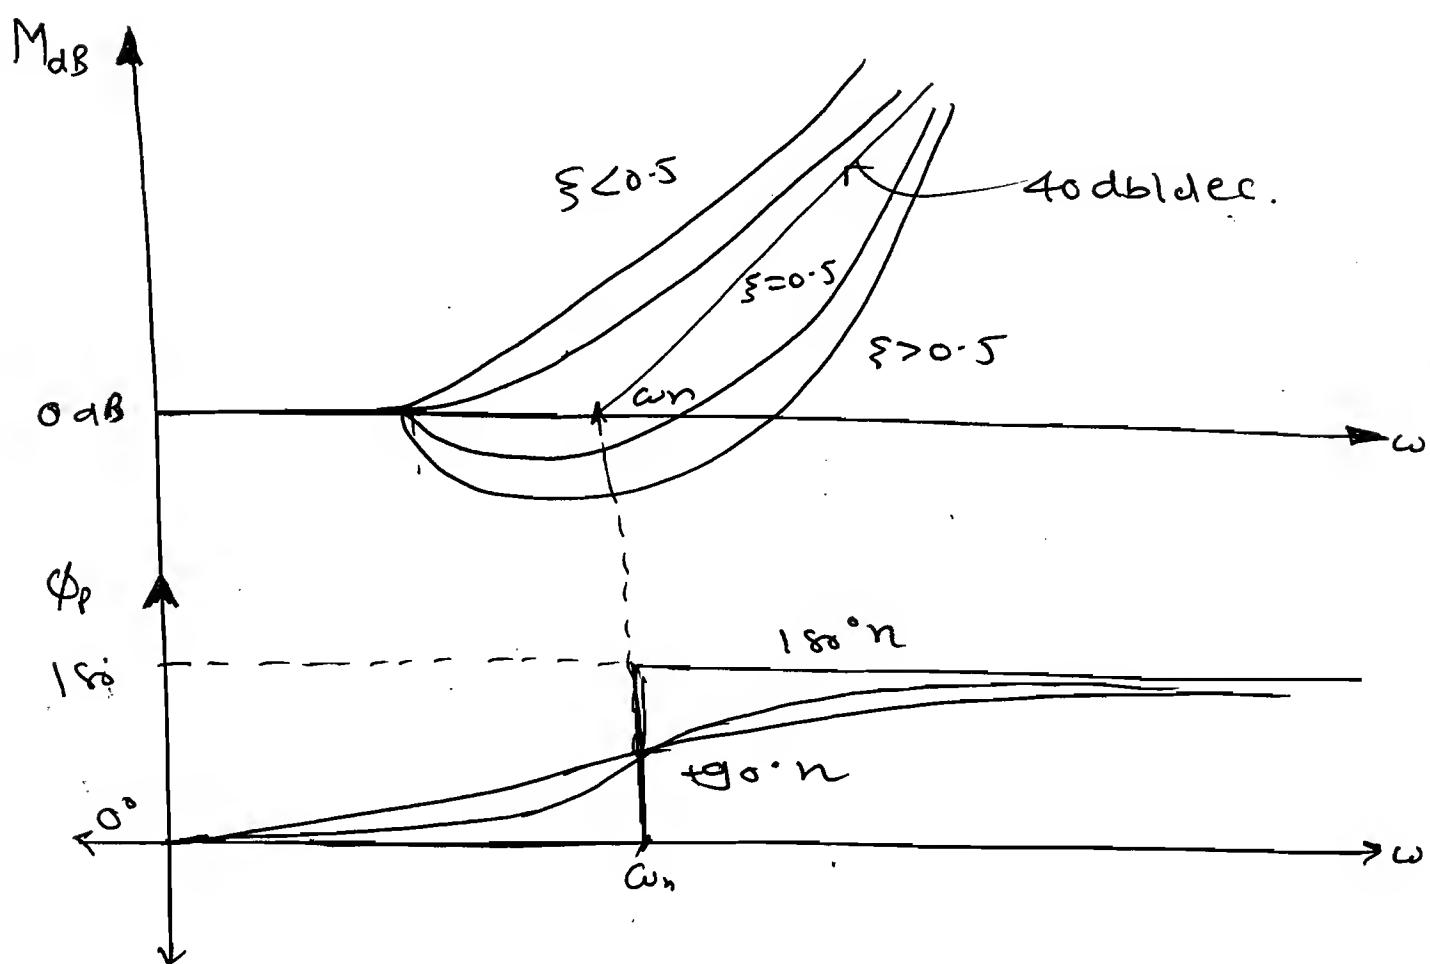

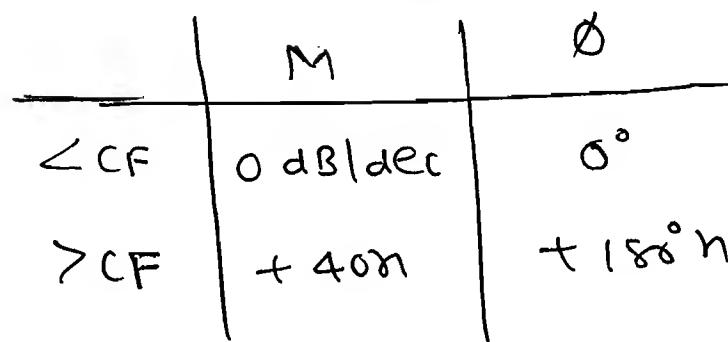

$$G_H(j\omega) = \left(1 - \left(\frac{\omega}{\omega_n} \right)^2 + j2\xi \left(\frac{\omega}{\omega_n} \right) \right)^n$$

$$\therefore M = |G_H(j\omega)| = \sqrt{\left(1 - \left(\frac{\omega}{\omega_n} \right)^2 \right)^2 + \left(2\xi \frac{\omega}{\omega_n} \right)^2}$$

$$M_{dB} = 20 \log \sqrt{\left(1 - \left(\frac{\omega}{\omega_n} \right)^2 \right)^2 + \left(2\xi \frac{\omega}{\omega_n} \right)^2}$$

$$\Rightarrow \phi_{actual} = n \tan^{-1} \left[\frac{2\zeta \omega / \omega_n}{1 - (\omega / \omega_n)^2} \right].$$

$\omega_n \rightarrow$ const freq.

\Rightarrow Correction at Corner freq. :-

$$M_{correction} = +20n \log(2\zeta) \text{ at CF } (\omega = \omega_n)$$

$$\phi_{correction \text{ at CF}} = +90^\circ$$

(a) Draw the Bode plot to the given system.

$$G_H(s) = \frac{s^2 \left(1 + s/20 + \frac{s^2}{100} \right)^4}{(1 + s/3 + s^2/9)^3 (1 + s/50)^4}$$

Soln: $\omega_n^2 = 9$

$\omega_{n_1} = 3 \text{ rad/sec.}$

$$\frac{2\zeta_1\omega}{\omega_n} = \frac{6}{3}$$

$$\frac{2\zeta_1}{2} = \frac{1}{3}$$

$$\boxed{\zeta_1 = 0.5}$$

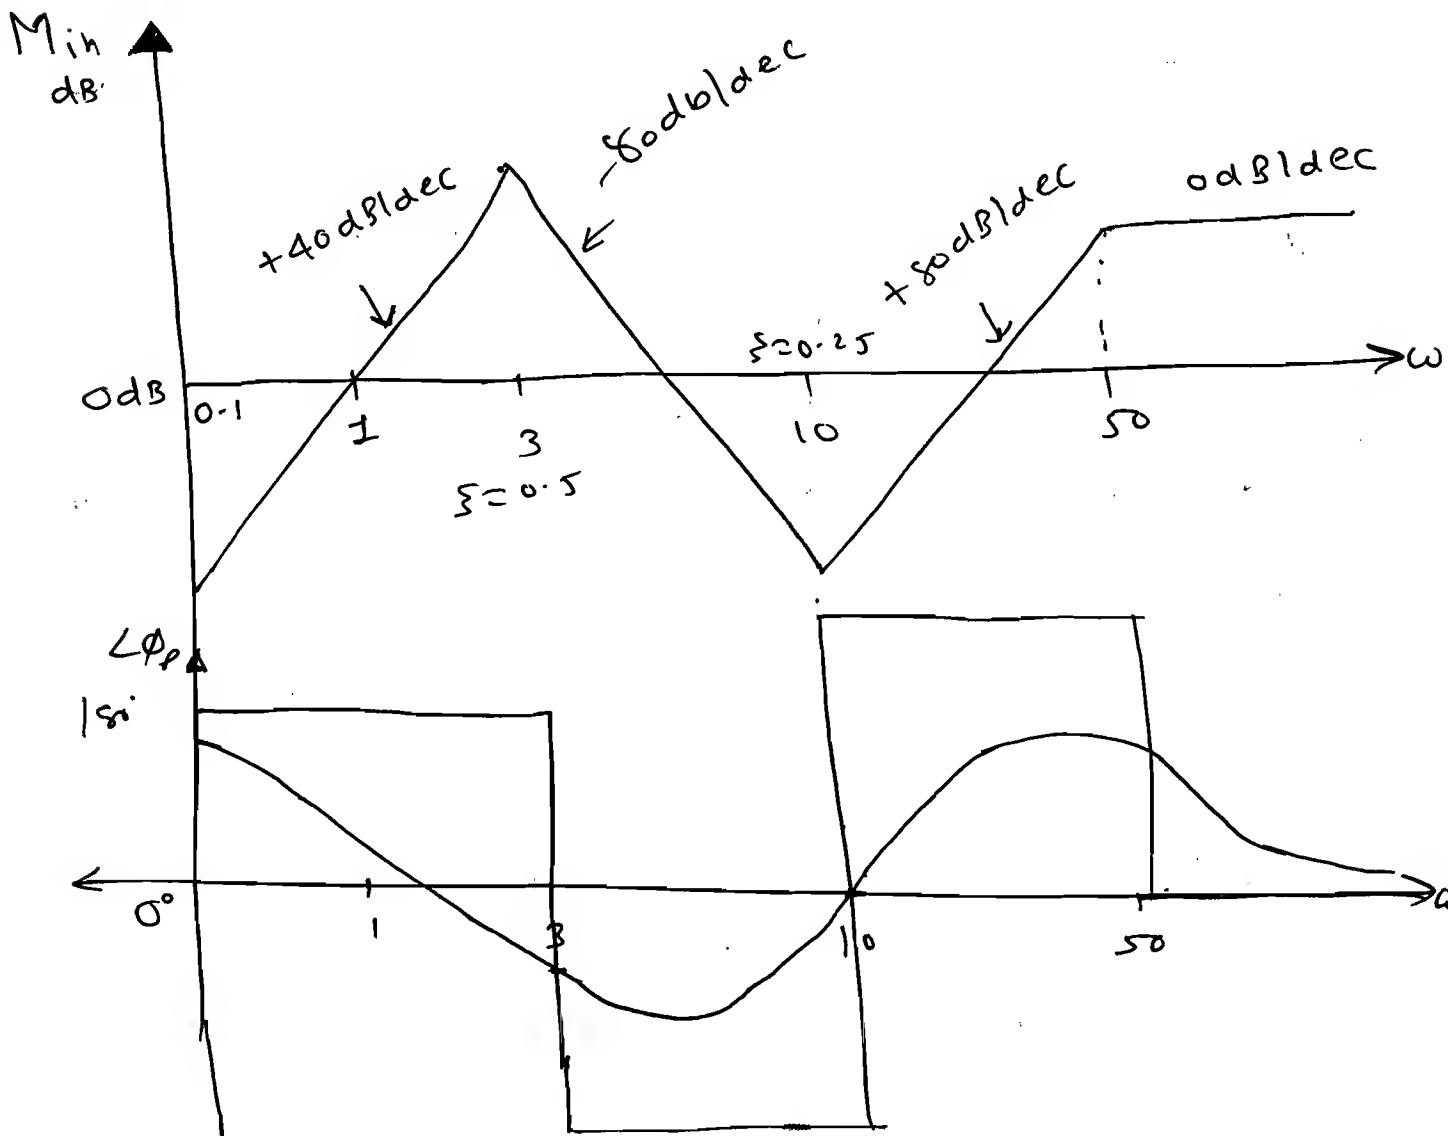

$$\omega_{n_2}^2 = 100$$

$$\omega_{n_2} = 10 \text{ rad/sec.}$$

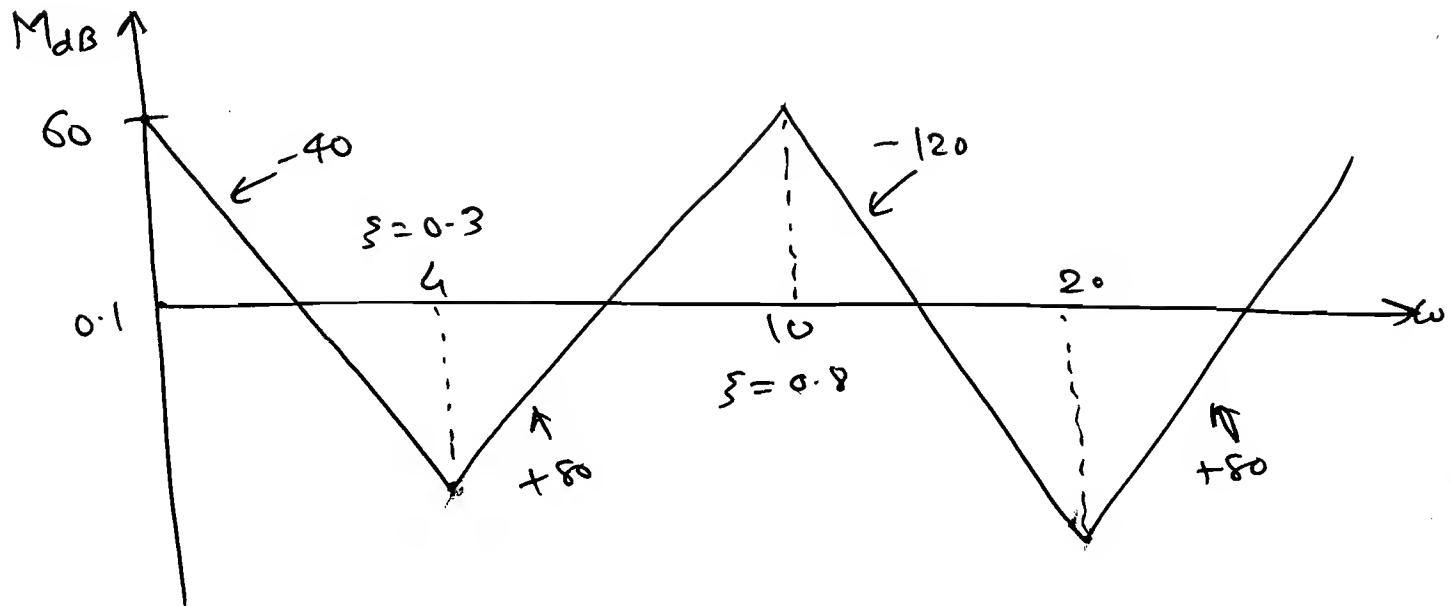

$$\frac{2\zeta_2}{\omega_n} = \frac{1}{20}$$

$$\therefore \boxed{\zeta_2 = 0.25}$$

$$\boxed{\omega_{n_3} = 50 \text{ rad/sec}}$$

(Q) Find the TF to the given asymptotic Mag. plot.

$$G_H(s) = K \frac{\left(1 + \frac{2(0.3)s}{4} + \frac{s^2}{16}\right)^3 \left(1 + \frac{s}{20}\right)^{10}}{s^2 \left(\frac{s^2}{100} + \frac{2(0.8)s}{10} + 1\right)^5}$$

$$M_{dB} \Big|_{\omega=0.1} = 60 \text{ dB.}$$

$$\Rightarrow 60 \text{ dB} = 20 \log K - 40 \log (0.1).$$

$$20 = 20 \log K$$

$$\log K = 1$$

$$\Rightarrow K = 10$$

$$\Rightarrow \boxed{TF = G_H(s) = \frac{10 \left(\frac{s^2}{16} + \frac{0.6}{4}s + 1 \right)^3 \left(1 + \frac{s}{20} \right)^{10}}{s^2 \left(\frac{s^2}{100} + 1.6s + 1 \right)^5}}$$

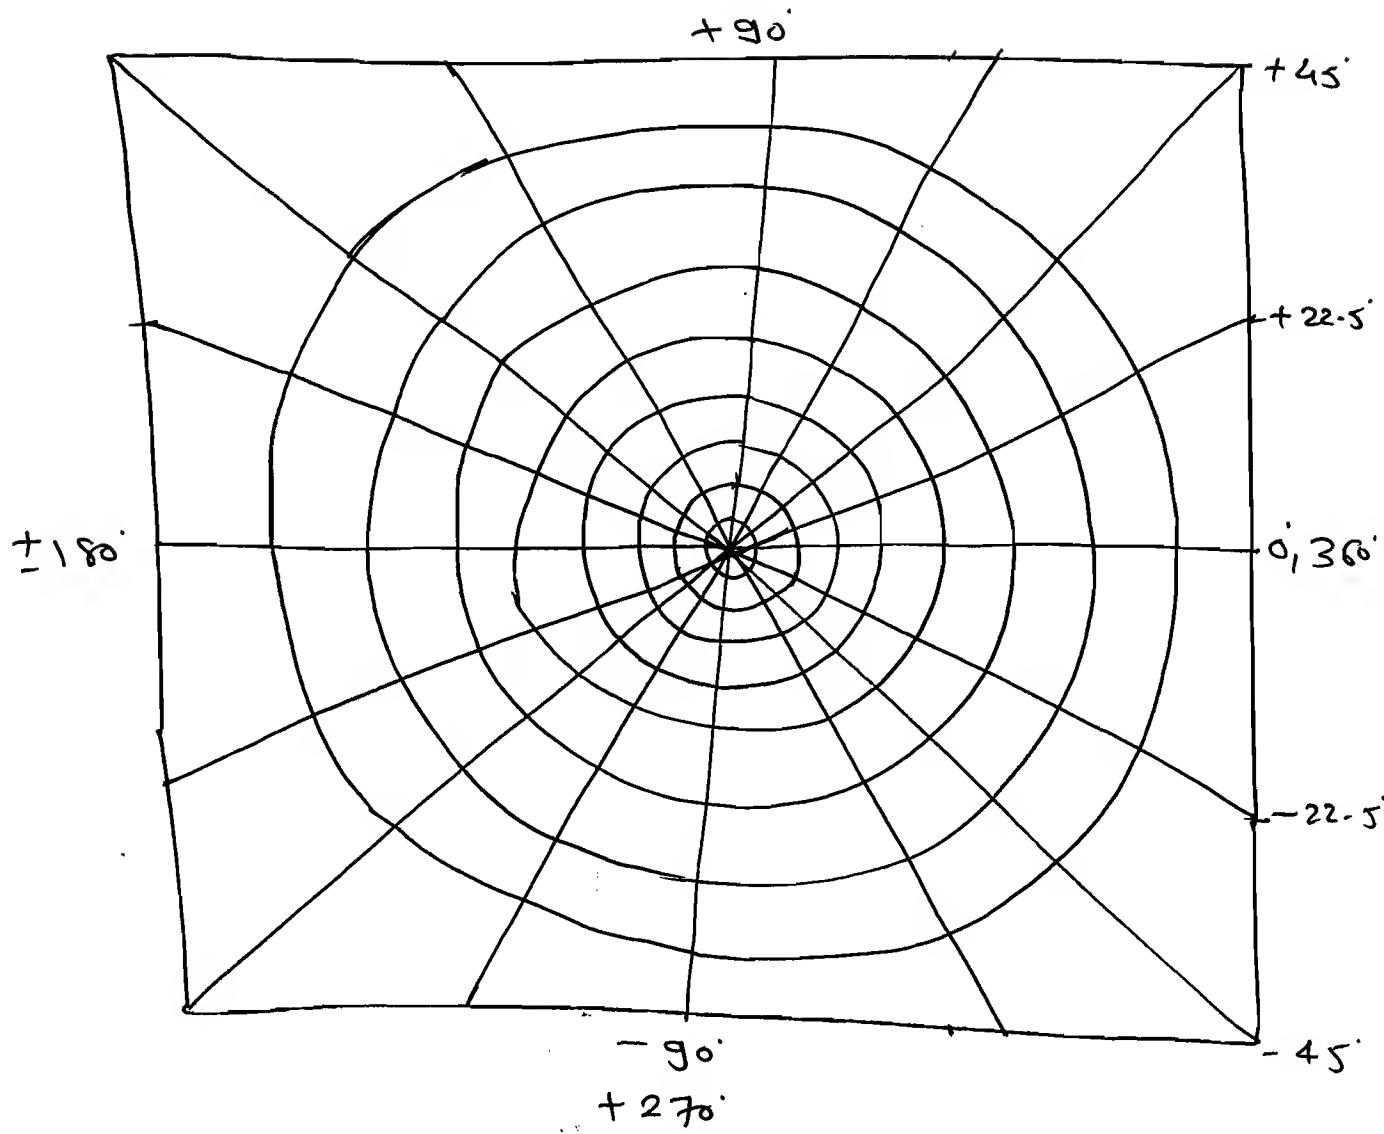

Polar Plots :-

* Purpose:

- ⇒ To draw the freq. response of the OLTF.
- ⇒ To find the CL system stability.
- ⇒ To find the gain margin and phase margin.
- ⇒ The Polar plots are used in the Nyquist plots.
- ⇒ The Polar plots is not a complete freq. response plots. The complete freq. response plots are Nyquist plots.
- ⇒ The freq. range for Polar plot is 0 to ∞ whereas for Nyquist plot the freq. range is $-\infty$ to $+\infty$.
- ⇒ The Polar plot is nothing but the Mag. verses Phase plot.

\Rightarrow

Q] Draw the Polar plot for $G_H(s) = \frac{1}{s}$.

$$\text{Soln: } G_H(s) = \frac{1}{s}.$$

* Procedure to draw the Polar plots:

Step-1:

⇒ Find the M_1 and ϕ_1 at $\omega=0$.

Step-2:

⇒ Find the M_2 and ϕ_2 at $\omega=\infty$.

Step-3:

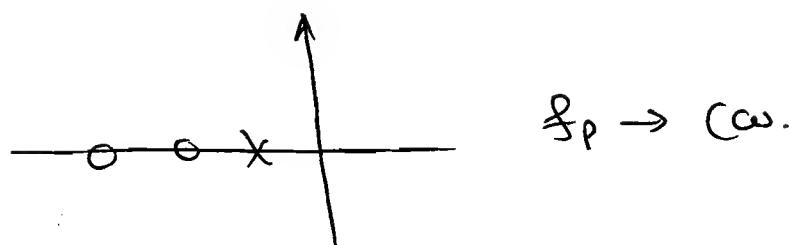

⇒ Ending direction

$$\begin{aligned} \phi_1 - \phi_2 &= +ve \rightarrow CCW. \\ &= -ve \rightarrow ACW. \end{aligned}$$

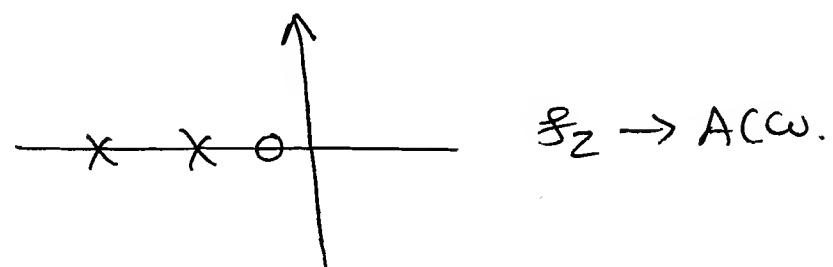

Step-4: Starting direction:

⇒ The starting direction is considered to the TF if it should have only +ve sign terms.

\Rightarrow If the finite pole is near to the imaginary axis then the S.D. is CCW.

\Rightarrow If finite zero near to imaginary then the S.D. is ACW.

\Rightarrow The above procedure is valid when M at origin i.e. $\omega=0$ is greater or equal to M at $\omega=\infty$.

$$M|_{\omega=0} \geq M|_{\omega=\infty}$$

\Rightarrow If the $M|_{\omega=0} < M|_{\omega=\infty}$ like HPF (When TF consist only zeros (or) zeros at origin and poles = zeros) check the Mag.)

\Rightarrow Like HPF do the polar plot using Standard procedure.

Q) Draw the Polar Plots for $G_H(s) = \frac{1}{s+1}$.

Soln: $G_H(s) = \frac{1}{s+1}$

$$s \rightarrow j\omega$$

$$\Rightarrow G_H(j\omega) = \frac{1}{j\omega + 1}$$

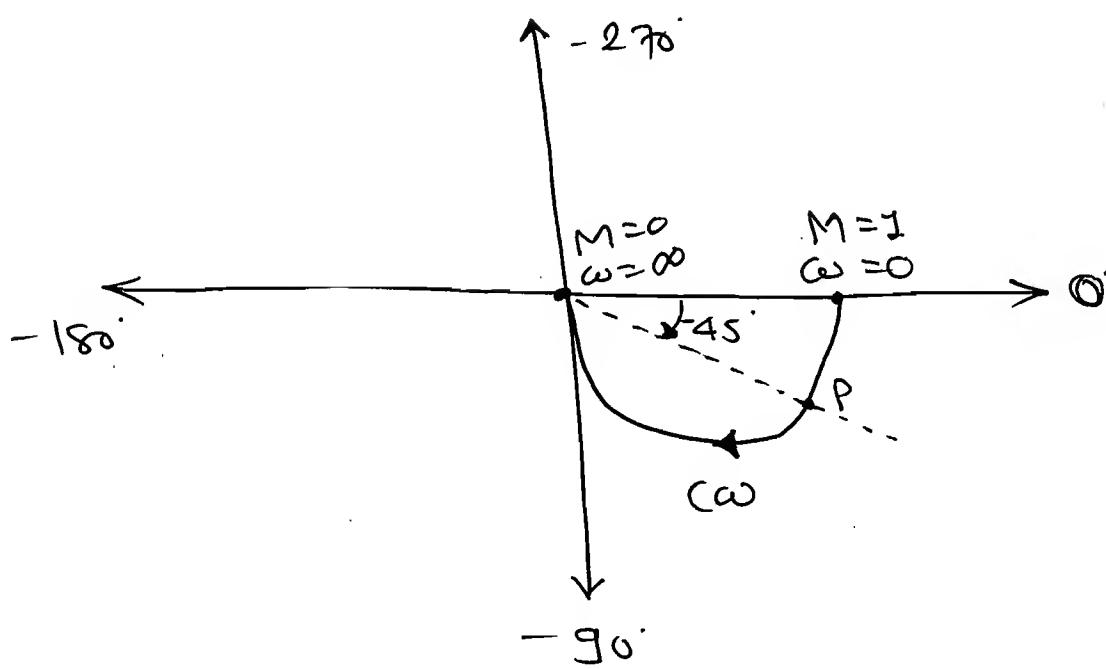

$$M = \frac{1}{\sqrt{\omega^2 + 1}}, \quad \angle \phi = -\tan^{-1}(\omega)$$

ω	M	ϕ
0	1	0°
∞	0	-90°

$$\phi_1 - \phi_2 = 0 - (-90^\circ) = 90^\circ$$

= +ve \Rightarrow E.D. \Rightarrow $C\omega$.

f-p \Rightarrow S.D. \Rightarrow $C\omega$.

\Rightarrow given $\phi = -45^\circ$

$$\therefore -45^\circ = -\tan^{-1}(\omega)$$

$$\therefore \omega = 1 \text{ rad/sec}$$

Rectangular

$$R \left(\frac{1}{2}, -\frac{1}{2} \right)$$

$$\Rightarrow M \Big|_{\omega=1} = \frac{1}{\sqrt{2}} = 0.707$$

$$\Rightarrow I.P. \boxed{P \left(\frac{1}{\sqrt{2}} \angle -45^\circ \right) \Rightarrow \text{polar}}$$

$$\text{Q} \quad G_H(s) = \frac{1}{(s+1)(s+2)}.$$

$$\text{Soln: } s \rightarrow j\omega$$

$$G_H(j\omega) = \frac{1}{(j\omega+1)(j\omega+2)}$$

$$M = |G_H(j\omega)| = \frac{1}{\sqrt{\omega^2+1} \times \sqrt{\omega^2+4}}$$

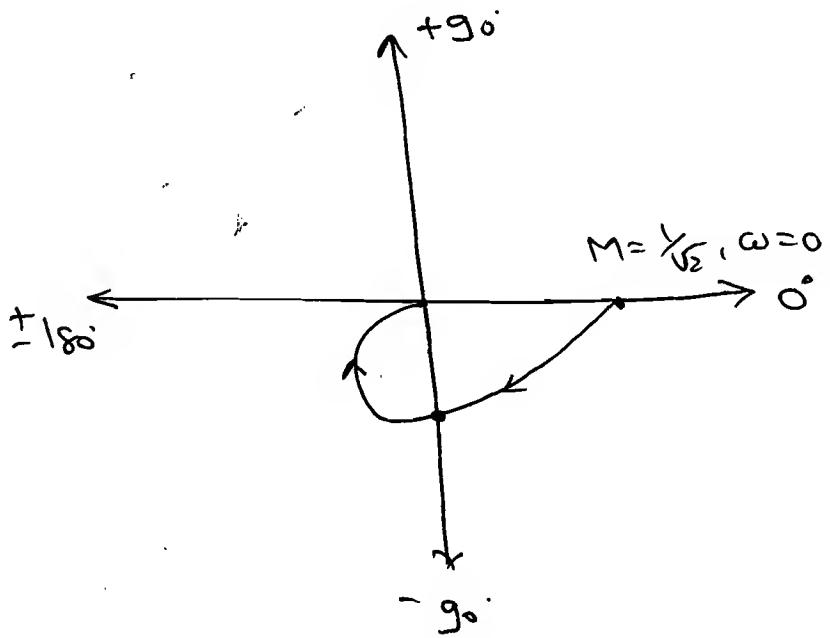

$$\phi = -\tan^{-1}(\omega) - \tan^{-1}(\omega_2)$$

$$\omega=0 \Rightarrow M = \sqrt{2} \text{ and } \phi_1 = 0^\circ$$

$$\omega \rightarrow \infty \Rightarrow M = 0 \text{ and } \phi_2 = -90^\circ - 90^\circ = -180^\circ$$

$$\text{E.O.} \Rightarrow \phi_1 - \phi_2 = 0 - (-180^\circ) = +180^\circ \Rightarrow \text{CCW.}$$

S.O. \Rightarrow CP \Rightarrow CCW.

\Rightarrow Intersection Point with -90° .

$$\therefore \phi = -90^\circ$$

$$\Rightarrow -90^\circ = -\tan^{-1}(\omega) - \tan^{-1}(\omega_2)$$

$$\Rightarrow 90^\circ = \tan^{-1}(\omega) + \tan^{-1}(\omega_2)$$

* Note:

Nyquist

Plot :-

* Purpose:-

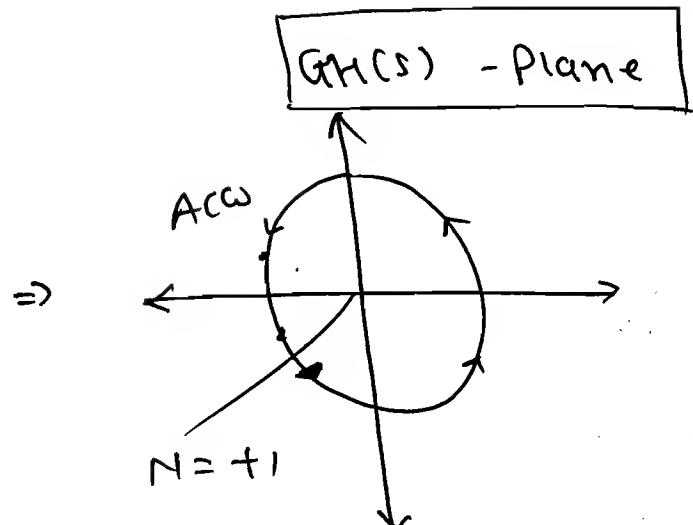

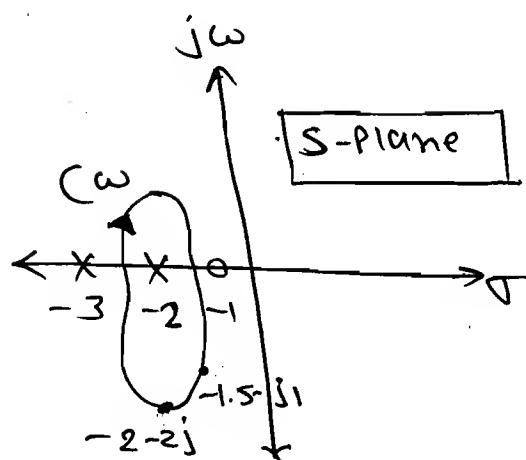

- ⇒ To draw the Complete freq. response of OLTF.
- ⇒ To find the range of K value for System Stability.
- ⇒ To find the no. of Close loop Poles in the Right of S-plane.
- ⇒ To find the Gain Margin, Phase Margin, Gain Cross over freq & Phase Cross over freq.
- ⇒ To find the Relative stability by using Gain Margin & Phase Margin.
- ⇒ The Nyquist Plot is developed by using a mathematical principle called Principle of Arguments.

* Principle of Arguments:

- ⇒ It states that if there are P Poles and the Z zeros are enclosed by the randomly Selected closed path than the corresponding Cr(s)-H(s) plane N-circles the origin with P-Z times i.e $N = P - Z$.

$$N = P - Z$$

e.g. $G_H(s) = \frac{(s+1)}{(s+2)(s+3)}$

$$N = P - Z$$

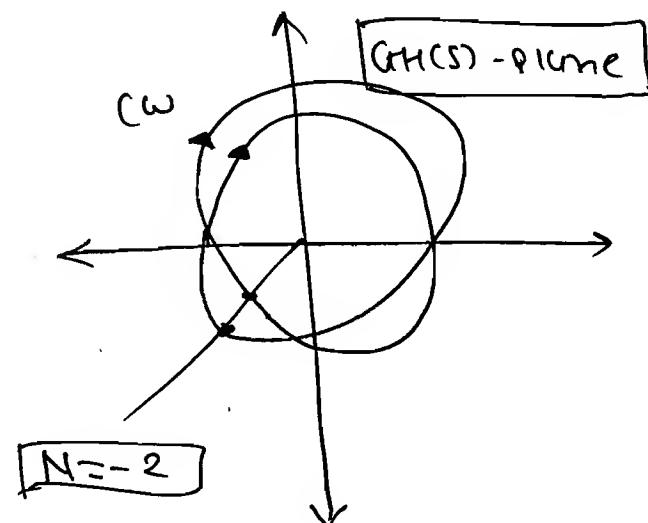

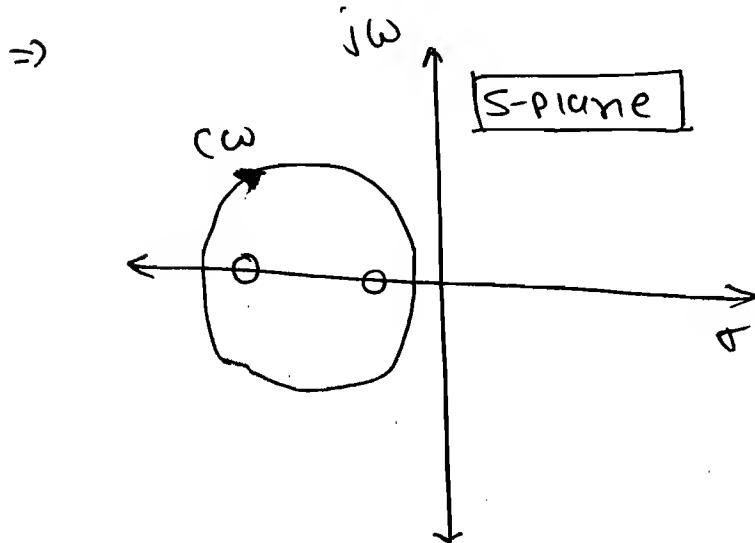

$$N = 1 - 0 = +1$$

\Rightarrow Pole \rightarrow Change in direction.

Zero \rightarrow No change in direction.

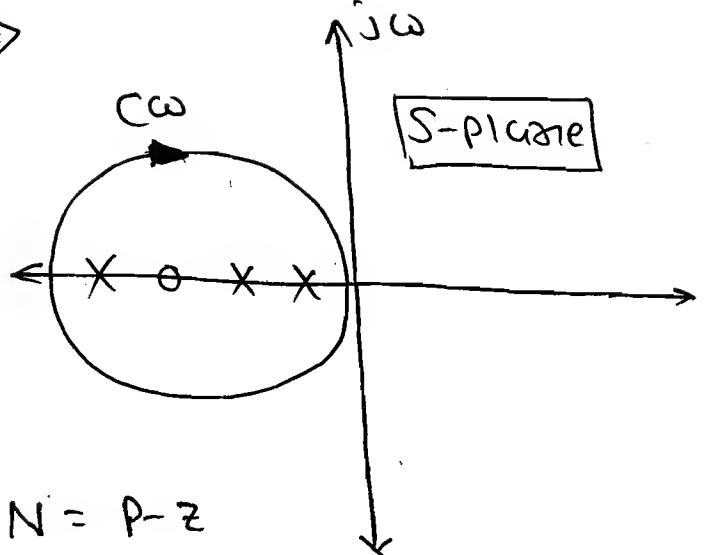

\Rightarrow

$ACW \rightarrow +ve$
$CW \rightarrow -ve$

$\Rightarrow N = P - Z$
 $N = 0 - 2 \Rightarrow N = -2$

\Rightarrow

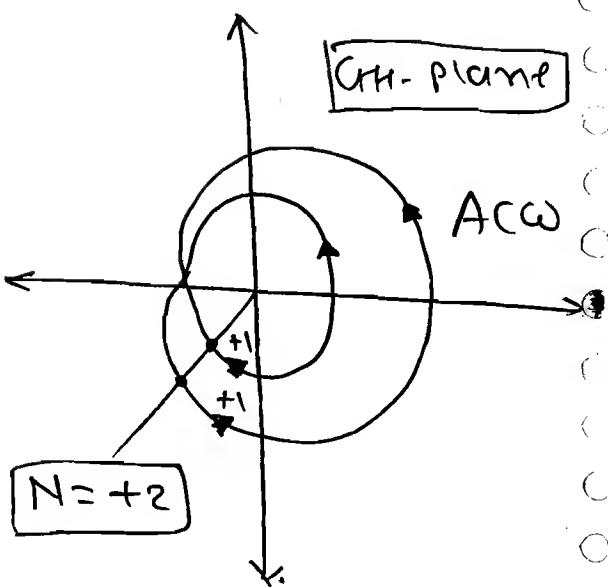

$$N = P - Z$$

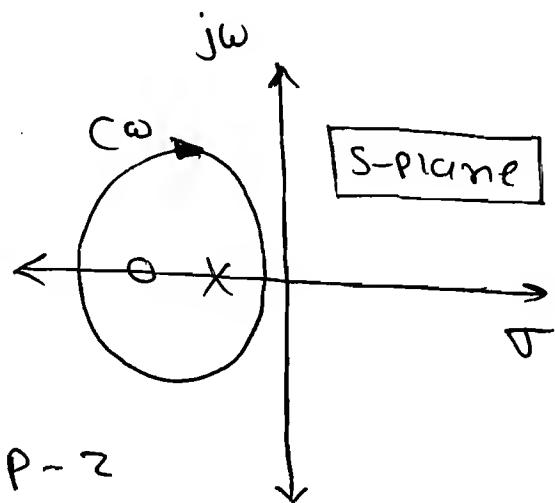

$$N = 3 - 1$$

$$\boxed{N = +2}$$

\Rightarrow

\Leftarrow

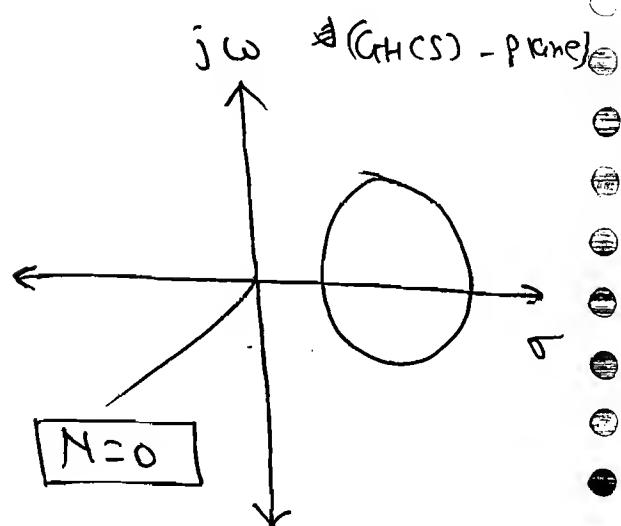

$$N = P - Z$$

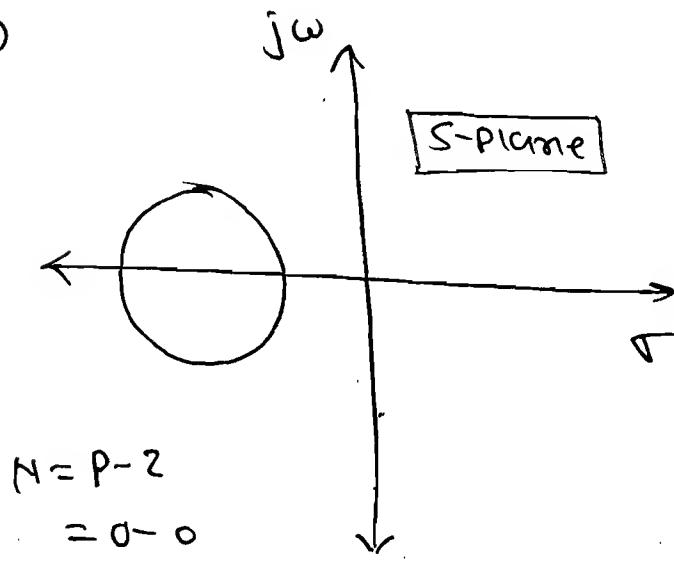

$$= 1 - 1$$

$$N = 0$$

\Rightarrow

\Leftarrow

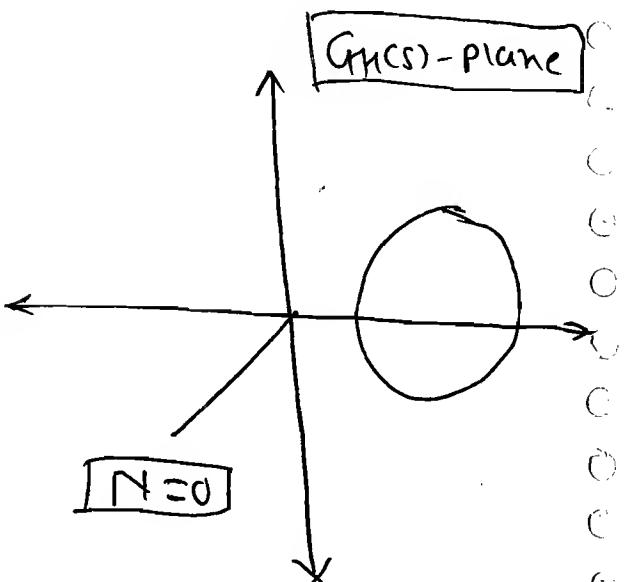

$$N = P - Z$$

$$= 0 - 0$$

$$\boxed{N = 0}$$

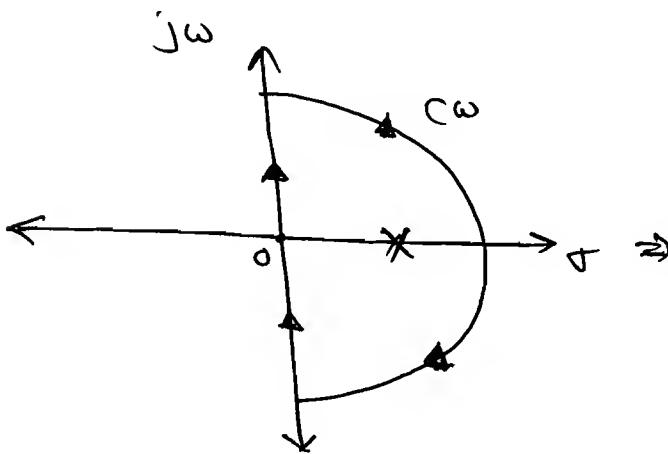

\Rightarrow

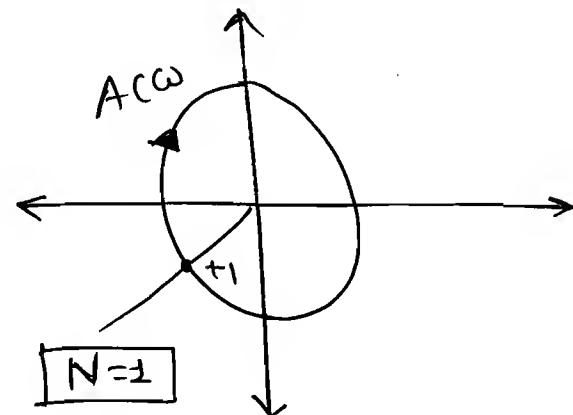

$$\boxed{N = 0}$$

\Rightarrow The Random Selected ^{Closed} Path Should not Pass through any Pole (or) zero.
 \Rightarrow The Principle of Arg. Concept is applied to the total Right half of S-plane with radius of ∞ .
 \Rightarrow The Nyquist Stability analysis is direct of S-plane analysis.

$$\Rightarrow G_H(s) = \frac{1}{(s-1)(s+2)(s+3)}$$

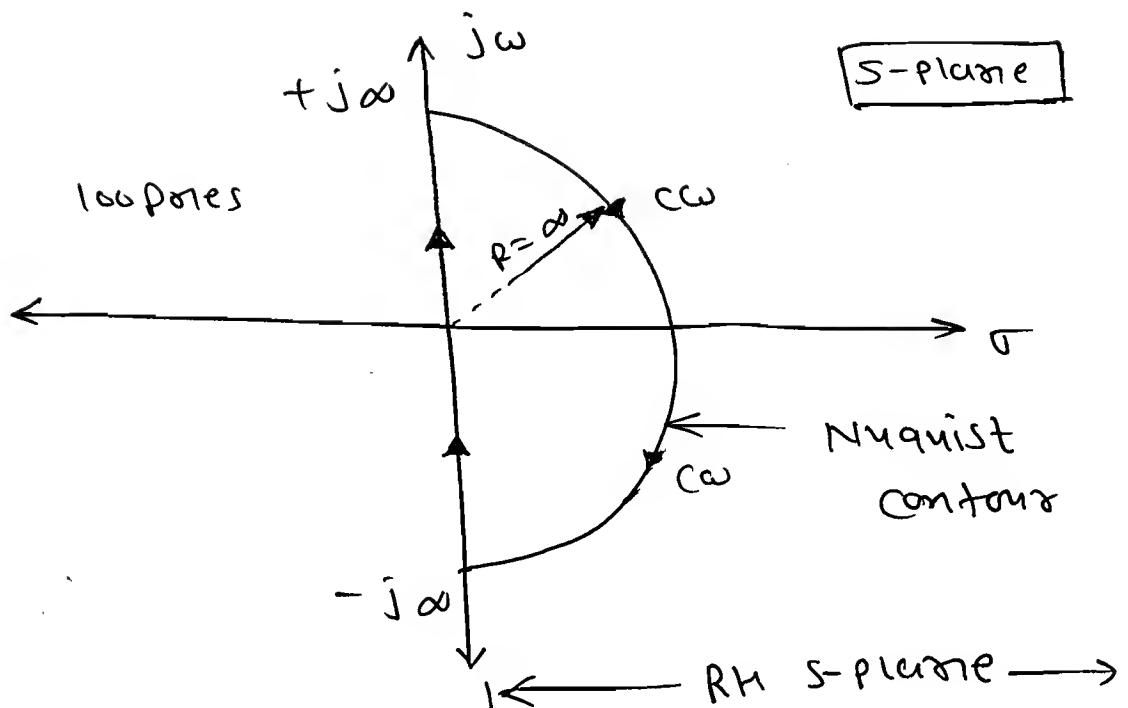

$$N = P - Z \\ = 1 - 0 = +1 \Rightarrow \boxed{N=+1}$$

\Rightarrow OL Sys. | OLTF
 $N = P - Z$
 ↓ ↓ ↓
 No. of OL Pole OL zero
 encirclements RH RH
 about origin

\Rightarrow

\Rightarrow To get about OLTF ($G(s)$) OL sys.

Consider N as a no. of encirclements about origin.

\Rightarrow P is no. of OL poles on Right of the S-plane.

\Rightarrow Z is no. of OL zeros on Right of the S-plane.

* Pole-Zero Configuration:-

\Rightarrow The open loop transfer function (OLTF) is given by.

$$G_H(s) = K \frac{N(s)}{D(s)} \quad \text{--- (1)}$$

\Rightarrow The CLTF is given by.

$$\frac{C(s)}{R(s)} = \frac{G(s)}{1 + G(s) \cdot H(s)}$$

$$T.F = \frac{C(s)}{R(s)} = \frac{G(s)}{1 + K \frac{N(s)}{D(s)}}.$$

$$\therefore T.F. = \frac{G(s) \cdot D(s)}{D(s) + K N(s)}. \quad (2)$$

\Rightarrow The Closed loop stability is given by Char. eqn.

$$q(s) = 1 + G(s) \cdot H(s)$$

$$= 1 + K \frac{N(s)}{D(s)}.$$

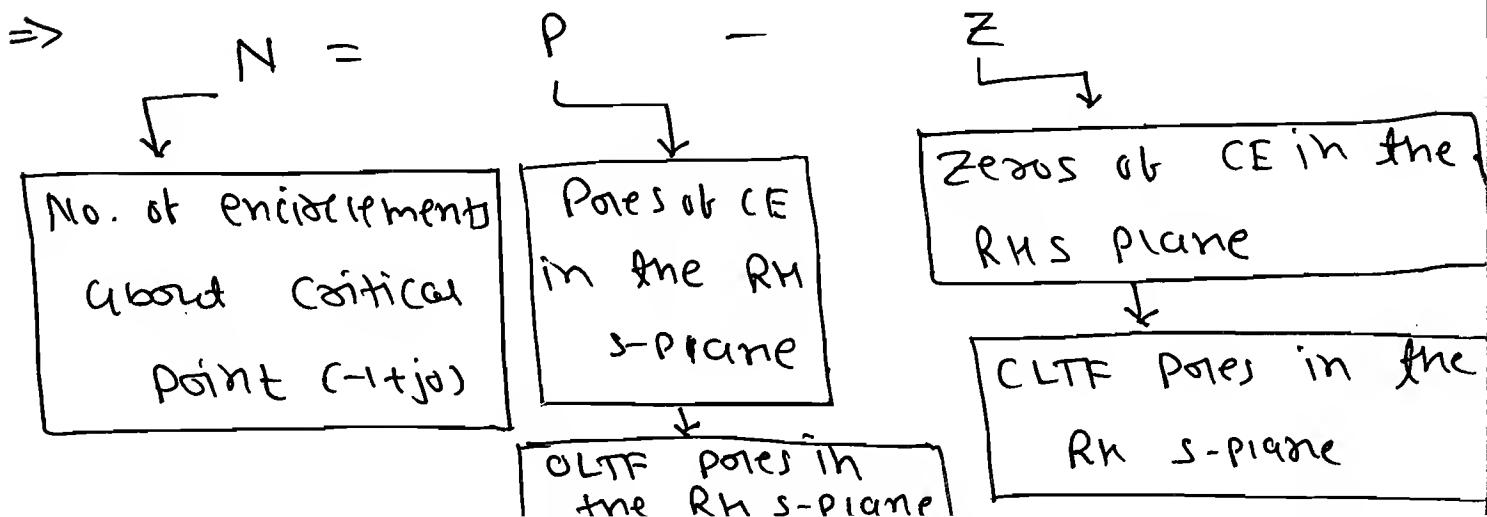

$$\therefore q(s) = \frac{D(s) + K N(s)}{D(s)}. \quad (3)$$

\Rightarrow Compute eqn - ① & ③.

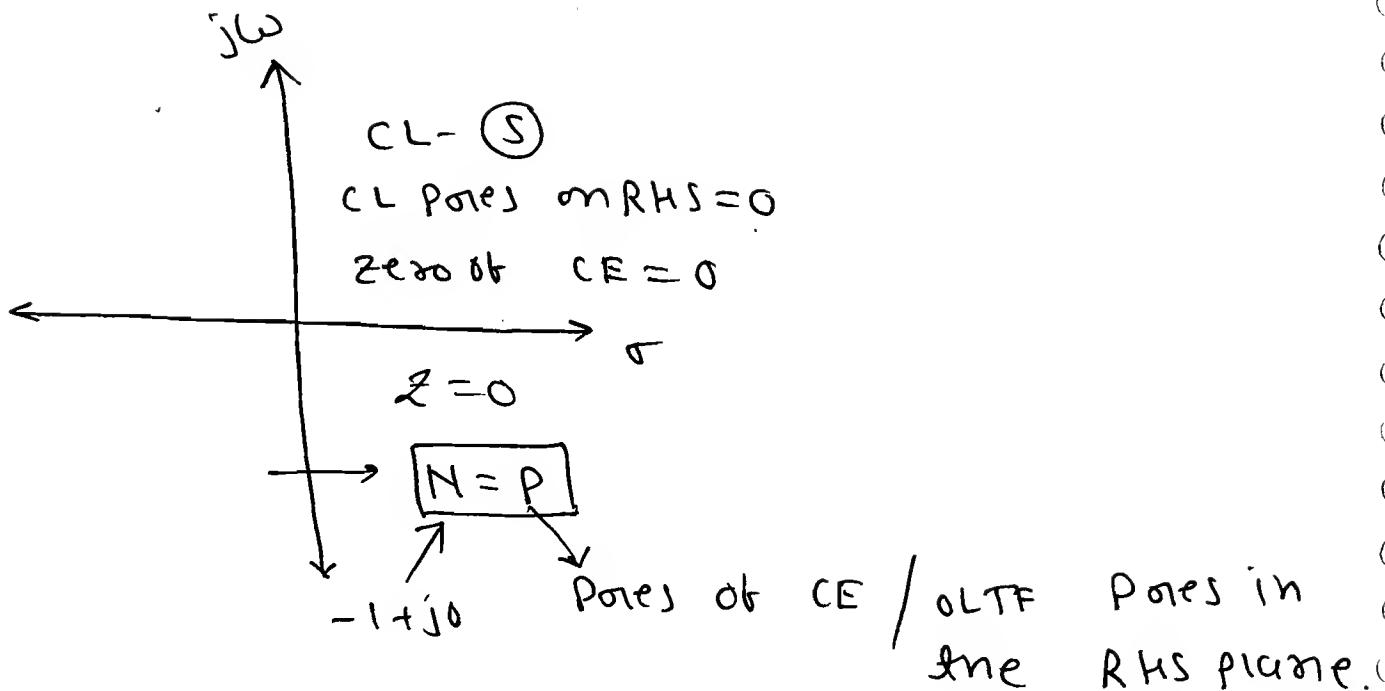

Poles of CE = OLTF Poles.

\Rightarrow Compute eqn ② & ③.

Zeros of CE = CLTF Poles.

\Rightarrow

\Rightarrow The Close-loop Pole is nothing but, zeros of CE which must be zero, in the right of S-plane that means

$$z=0 \text{ & } N = P - z = P$$

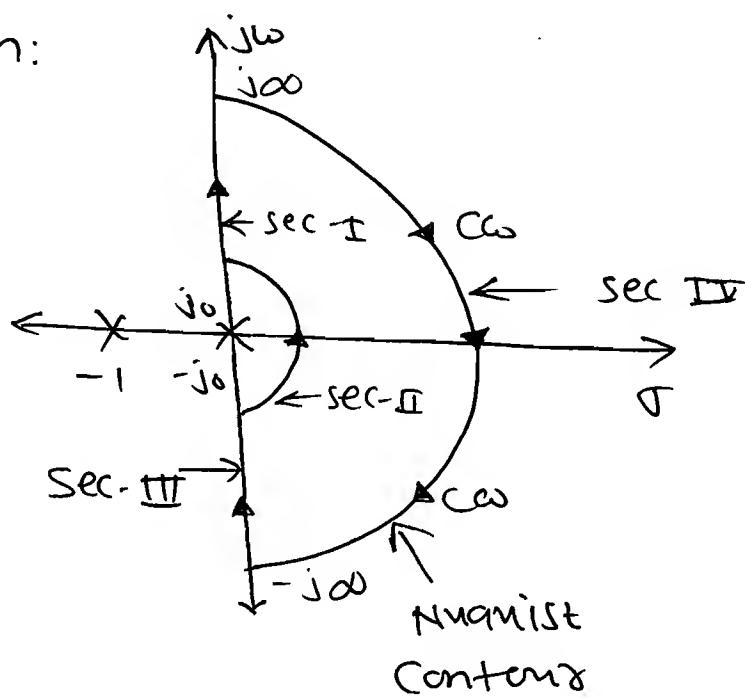

* Nyquist Stability Criterion:-

\Rightarrow It states that the No. of H-encirclements about the critical point must be equal to poles of char. eqn which are nothing but OLTF poles in the Right of S-plane, i.e. $z=0$, $N=P$.

Q Draw the Nyquist plot & find the sys. Stability to the following sys.

$$G(s) \cdot H(s) = \frac{1}{s(s+1)}.$$

Soln:

$$M = \frac{1}{\omega \sqrt{\omega^2 + 1}}$$

$$\phi = -90^\circ - \tan^{-1}(\omega)$$

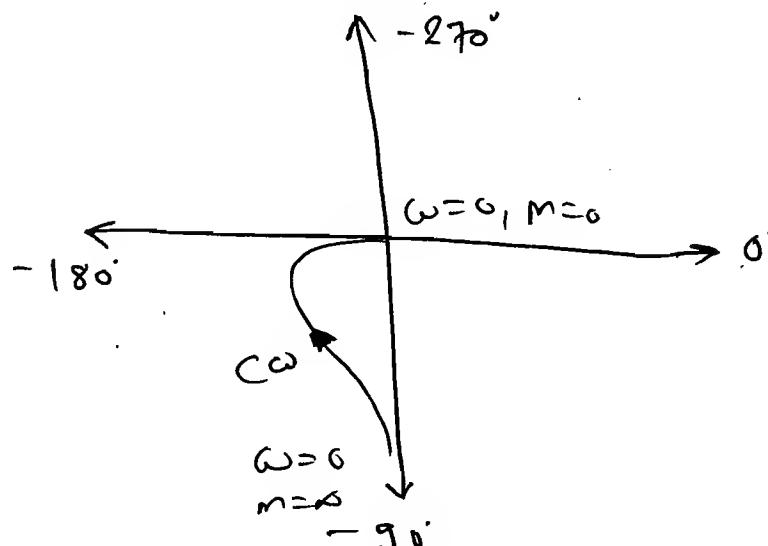

\Rightarrow Sec-I:

$$\rightarrow \omega = 0^+ \Rightarrow M = \infty, \phi = -90^\circ$$

$$\omega = \infty^+ \Rightarrow M = 0, \phi = -180^\circ$$

$$S.D. \Rightarrow f_p \Rightarrow C\omega$$

$$E.D. \Rightarrow \phi_1 - \phi_2 = +ve \Rightarrow C\omega.$$

\Rightarrow Sec-II:

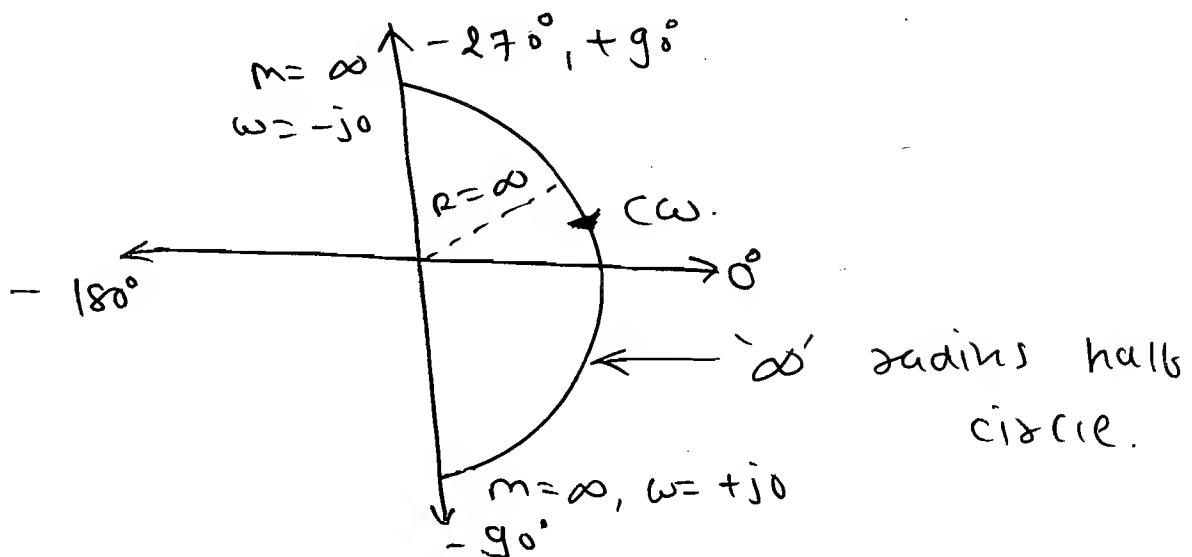

$$\Rightarrow \text{No. of Poles} = \infty, \quad \phi = -90^\circ + (180 - \tan^{-1}(0)).$$

$$\phi = +90^\circ$$

$$\omega = +j\omega \Rightarrow \text{No. of Poles} = \infty, \quad \phi = -90^\circ$$

$$E.D. \Rightarrow \phi_1 - \phi_2 = +90^\circ \Rightarrow C\omega.$$

S.D. \Rightarrow C. ω .

$$\Rightarrow \angle \frac{1}{s} \Big|_{s=+j\omega} = \frac{\angle 1}{\angle +j\omega} = -90^\circ$$

$$\angle \frac{1}{s} \Big|_{s=-j\omega} = \frac{\angle 1}{\angle -j\omega} = \frac{+90^\circ}{180^\circ \times 1} = \frac{+90^\circ}{180^\circ}$$

$$\Rightarrow \angle \frac{1}{s^3} = \frac{\angle 1}{3 \angle +j\omega} = -270^\circ$$

$$\angle \frac{1}{s^3} = \frac{\angle 1}{3 \angle -j\omega} = +270^\circ$$

$$s=j\omega \Rightarrow \boxed{180^\circ \times 3}$$

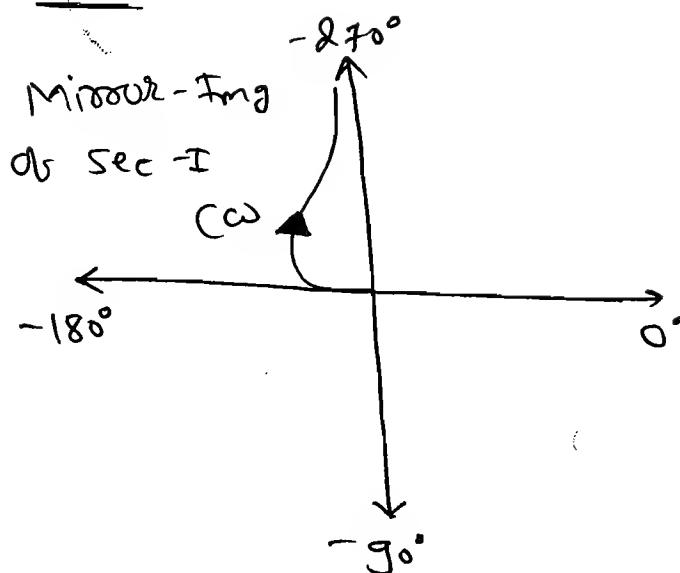

$$\boxed{180^\circ \times 3}$$

3-pole at origin.

Note: No. of 'infinity' radius half (180°)

Circles = No. of Poles at origin.

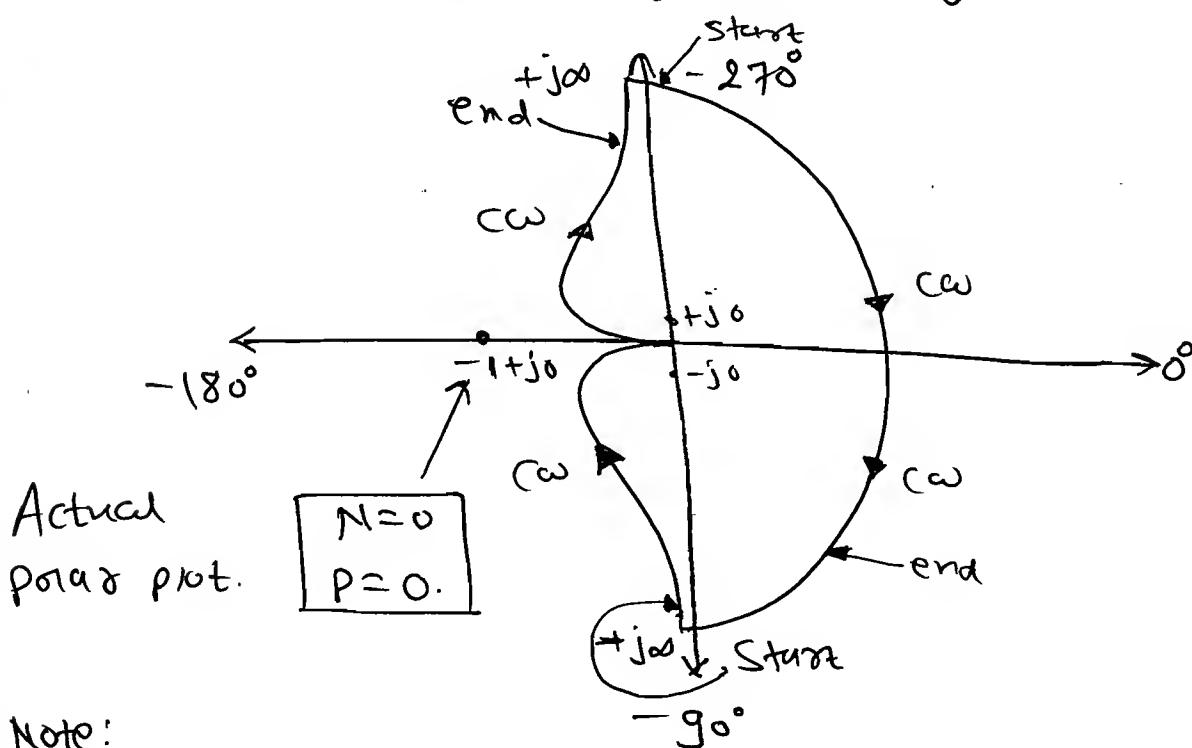

Sec-III :-

\Rightarrow Sec-III is a mirror-image of Sec-I, about the Real axis but the direction is continuous.

\Rightarrow Section-IV:

\Rightarrow The Sec-IV gives the magnitude of at $\omega \approx \infty \Rightarrow m = \pm 0$. that means it is a point at origin. neglect the Sec-IV.

Note:

\Rightarrow The ∞ radius half circle should be start where the mirror img. end & the ∞ radius half circle end where the actual polar plot is start.

\Rightarrow The ∞ radius half circle direction always CW because it depends on Nyquist contour direction.

$$\text{Q} \quad G_{H(S)} = \frac{10}{(S+1)}$$

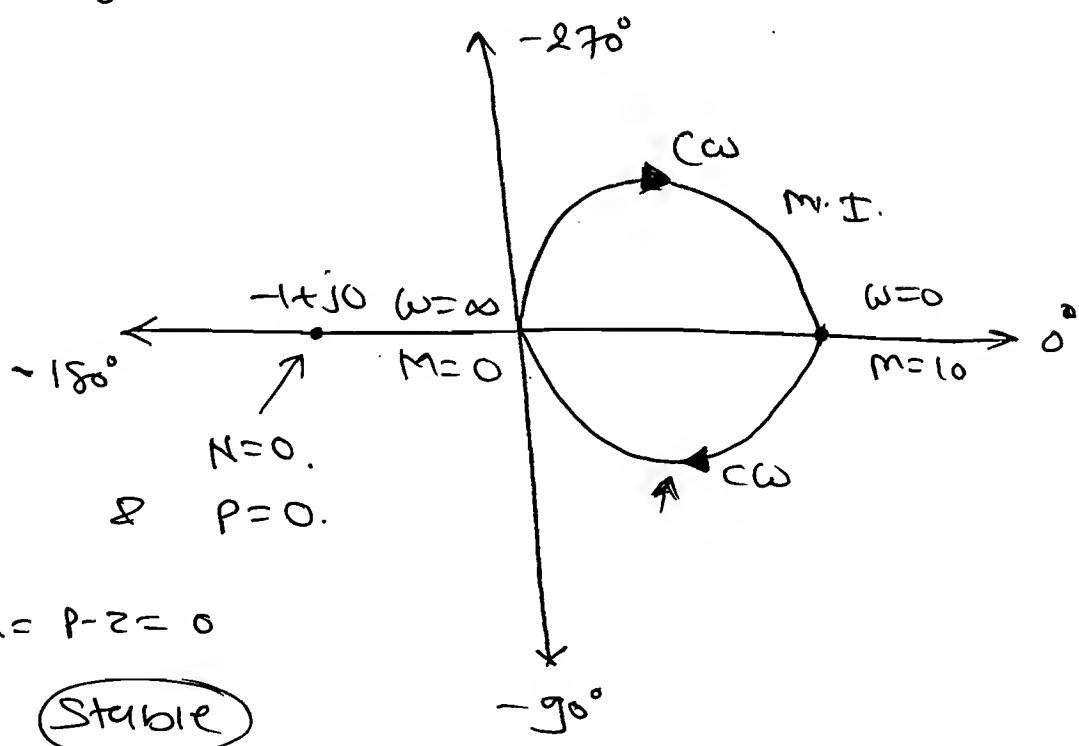

$$\text{Soln: } M = \frac{10}{\sqrt{\omega^2 + 1}} \quad \& \quad \phi = -\tan^{-1}(\omega)$$

$$\omega = 0 \Rightarrow M = 10 \quad \& \quad \phi = 0^\circ$$

$$\omega = \infty \Rightarrow M = 0 \quad \& \quad \phi = -90^\circ$$

$$E.D. \Rightarrow \phi_1 - \phi_2 = +ve \Rightarrow C.W$$

$$S.D. \Rightarrow f_P = C.W$$

$$\text{Q} \quad G_{H(S)} = \frac{10}{(S+1)(S+2)}$$

$$\text{Soln: } M = \frac{10}{\sqrt{\omega^2 + 1} \times \sqrt{\omega^2 + 4}}$$

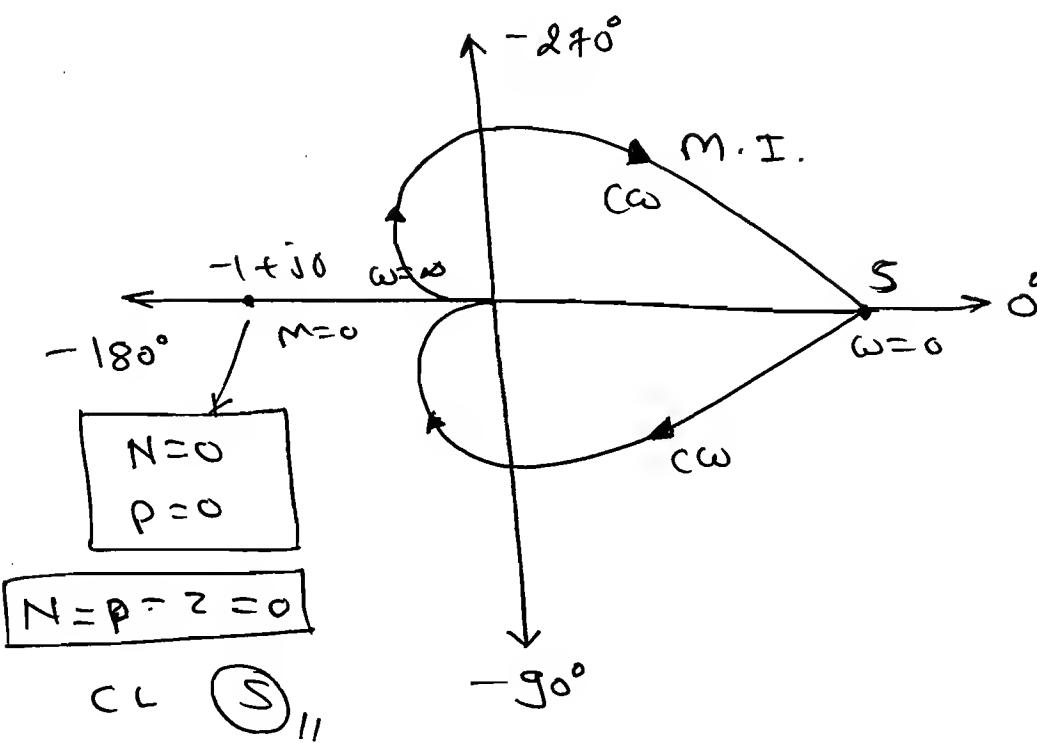

$$\phi = -\tan^{-1}(\omega) - \tan^{-1}(\omega/2)$$

$$\Rightarrow \omega = 0 \Rightarrow M = \frac{10}{2} = 5, \phi_1 = 0^\circ$$

$$\omega = \infty \Rightarrow M = \infty, \phi_2 = -180^\circ.$$

$$\underline{\text{E.D.}} \Rightarrow \phi_1 - \phi_2 = +\infty = C\omega.$$

$$\underline{\text{S.D.}} \Rightarrow f_p = C\omega.$$

$$\boxed{Q} \quad G_{HCS} = \frac{10}{S^2 (S+1)(S+z)}.$$

$$\stackrel{S_{out}}{=} M = \frac{10}{\omega^2 \sqrt{\omega^2 + 1} \times \sqrt{\omega^2 + 4}}.$$

$$\phi = -180^\circ - \tan^{-1}(\omega) - \tan^{-1}(\omega_2).$$

$$\omega = 0 \Rightarrow M = \infty, \phi = -180^\circ$$

$$\omega = \infty \Rightarrow M = 0, \phi = -360^\circ$$

$$\underline{\text{E.D.}} \Rightarrow \phi_1 - \phi_2 = +\infty = C\omega$$

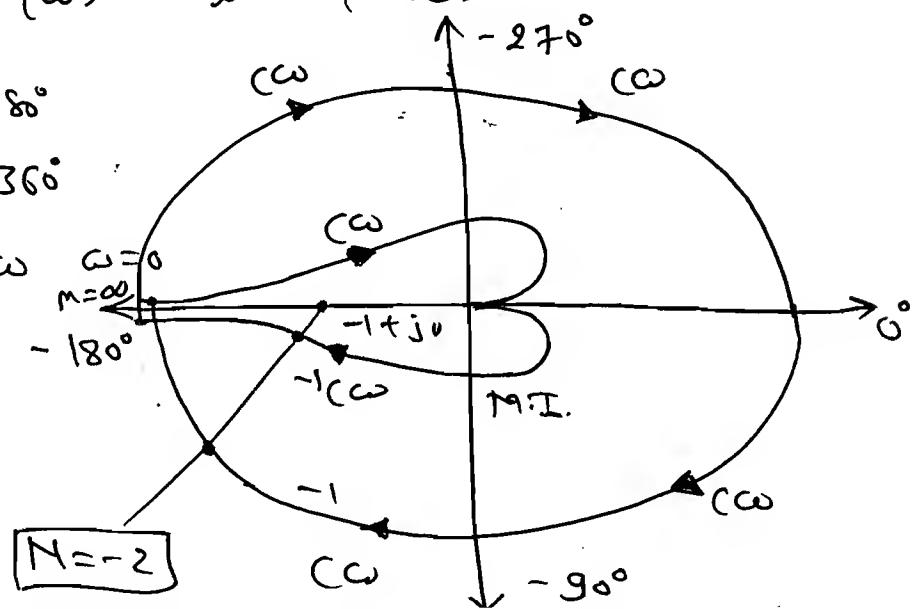

$$\underline{\text{S.D.}} \Rightarrow f_p = C\omega.$$

$$P=0$$

$$z=0$$

$$\text{so, } \boxed{N \neq P}$$

$$\Rightarrow \text{US}$$

\Rightarrow Here, $N = -2$, but $P = 0$

so, $N \neq P \Rightarrow$ CL US.

$$\Rightarrow N = P - Z$$

$$Z = P - N$$

$$Z = 0 - (-2)$$

$Z = 2$ \Rightarrow Z^{pole} in the Right of S-plane.

(Q) $G_H(s) = \frac{10}{s^3(s+10)}$.

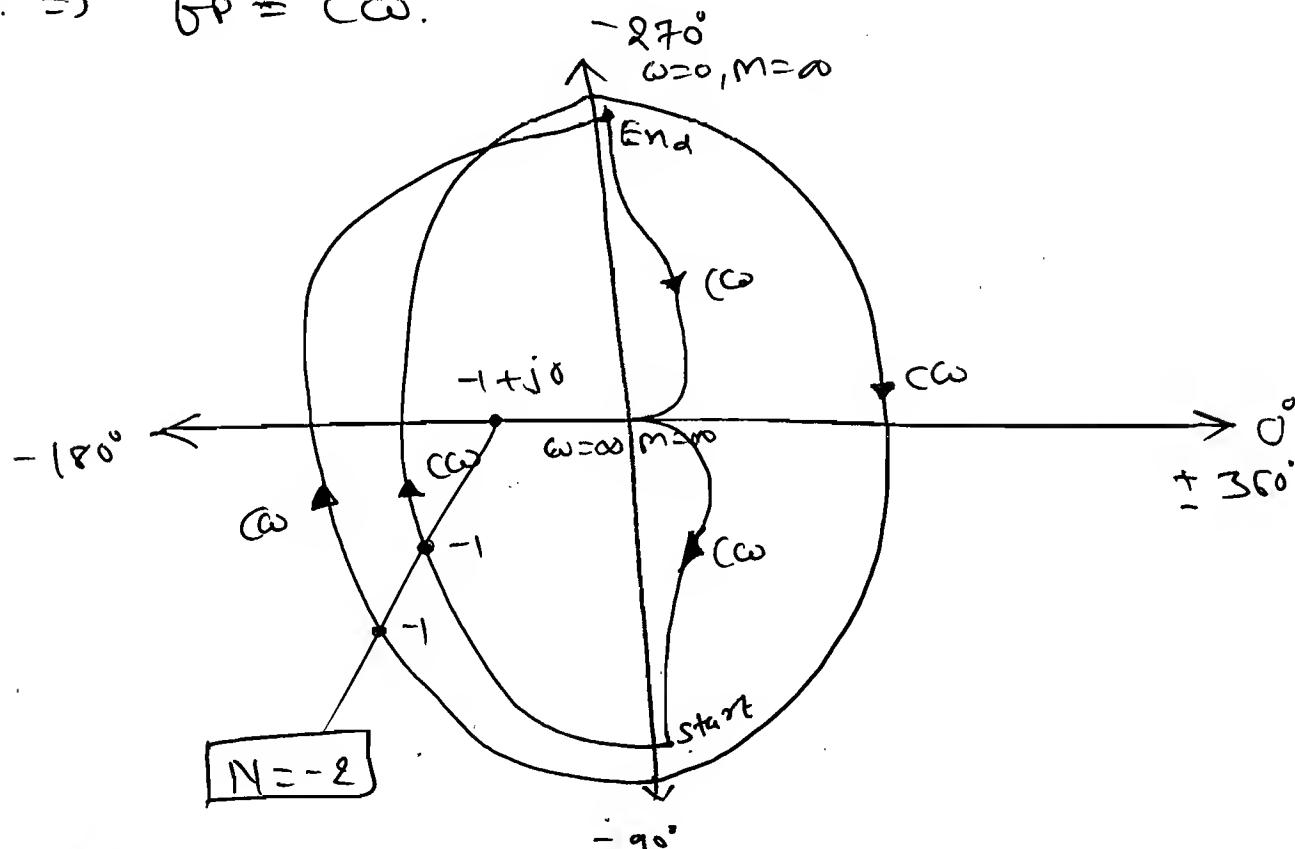

Soln: $M = \frac{10}{\omega^3 \sqrt{\omega^2 + 100}}$, $\phi = -270^\circ - \tan^{-1}(\omega/10)$

$$\Rightarrow \omega=0 \Rightarrow M=\infty, \phi_1 = -270^\circ$$

$$\Rightarrow \omega=\infty \Rightarrow M=0, \phi_2 = -360^\circ$$

$$\text{E.D.} \Rightarrow \phi_1 - \phi_2 = +ve = C\omega$$

$$\text{S.D.} \Rightarrow 6P = C\omega$$

$$P-Z = 0-0=0$$

$$\Rightarrow [N \neq P] \Rightarrow \text{US}$$

\Rightarrow The no. of CL Poles on RHS plane

$$N = P - Z$$

$\therefore -2 = 0 - Z \Rightarrow \boxed{Z = 2} \rightarrow$ CL Poles on RHS S-plane.

$$\boxed{(c)} \quad C_H(s) = \frac{1}{s(1-s)}.$$

$$\underline{\underline{\text{Sum}}}: \quad M = \frac{1}{\omega \sqrt{\omega^2 + 1}}, \quad \phi = -90^\circ - (-\tan^{-1} \omega), \\ \phi = -90^\circ + \tan^{-1} \omega.$$

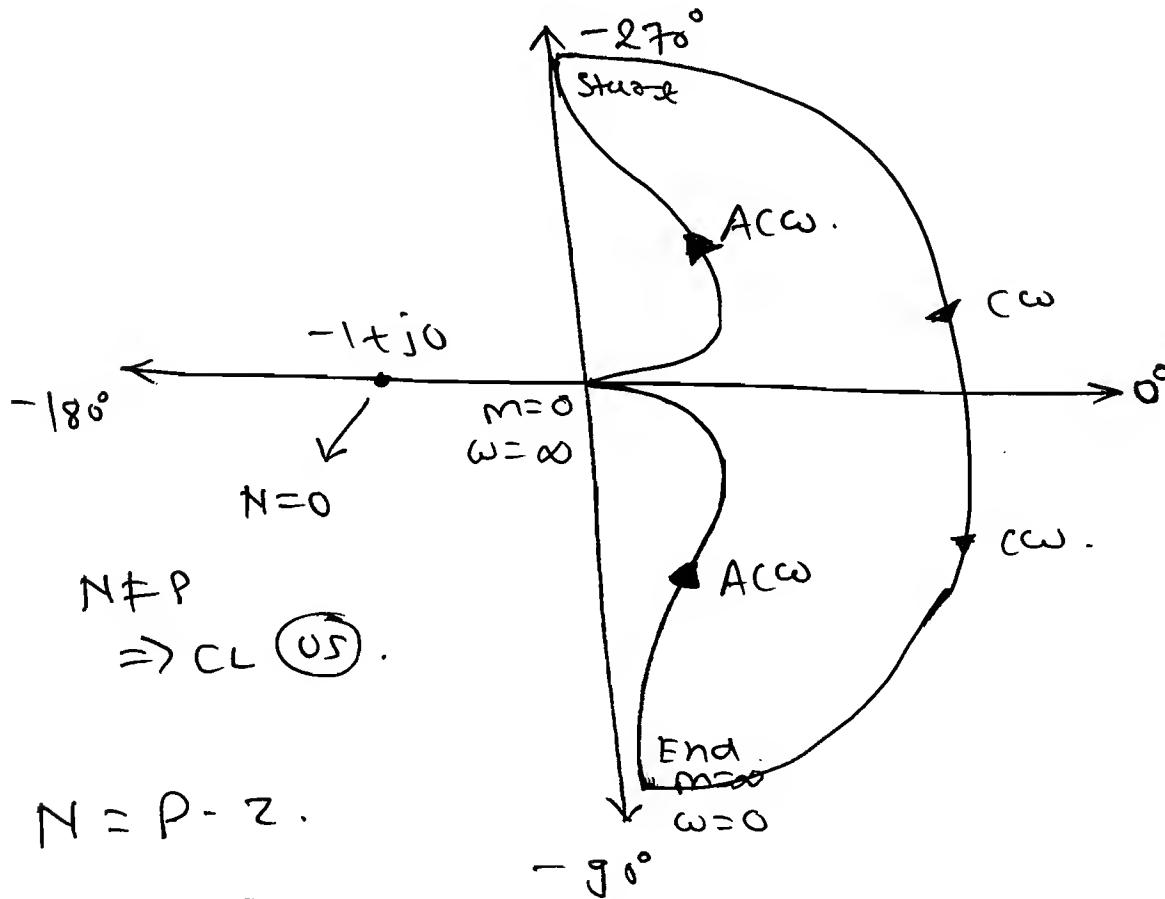

$$\omega=0 \Rightarrow M=\infty, \phi=-90^\circ$$

$$\boxed{P=1}$$

$$\omega=\infty \Rightarrow M=0, \phi=0^\circ$$

$$\underline{\underline{\text{E.D.}}} \Rightarrow \phi_1 - \phi_2 = -\nu e \Rightarrow A(\omega).$$

$$\underline{\underline{\text{S.D.}}} \times (\because -\nu e \text{ sign in T.F.})$$

$$N \neq P \\ \Rightarrow \text{CL } \textcircled{05}.$$

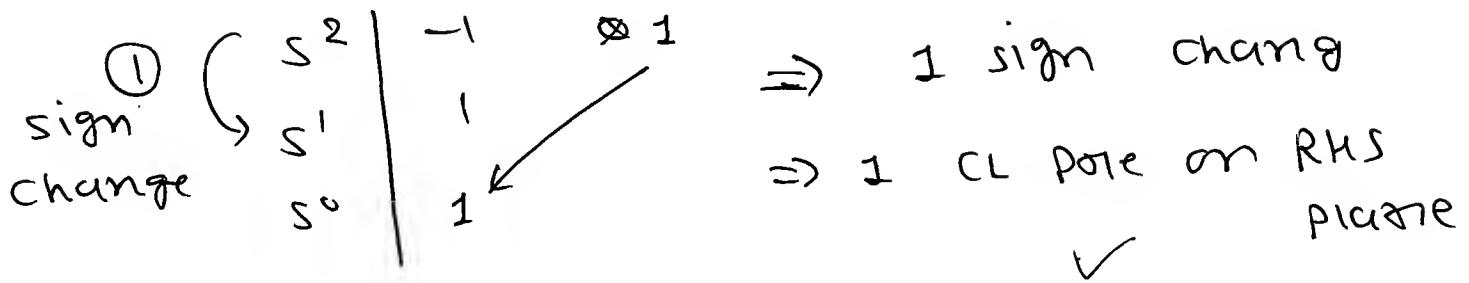

$$\Rightarrow N = P - Z.$$

$$\therefore O = 1 - Z.$$

$$\Rightarrow \boxed{Z=1} \Rightarrow 1 \text{ CL pole on RHS plane.}$$

(OR) By RH- criterion

$$\begin{aligned} \text{CE} \rightarrow & 1 + G(s)H(s) = 0 \\ \Rightarrow & 1 + \frac{1}{s(1-s)} = 0 \\ \Rightarrow & s - s^2 + 1 = 0 \\ \Rightarrow & -s^2 + s + 1 = 0 \end{aligned}$$

Q] Find the range of K value for close loop system stability by using Nyquist Stability Analysis, for the following system.

$$G(s)H(s) = \frac{K}{(s+1)(s+2)(s+3)}$$

$$\text{Soln: } M = \frac{K}{\sqrt{\omega^2 + 1} \times \sqrt{\omega^2 + 4} \times \sqrt{\omega^2 + 9}}$$

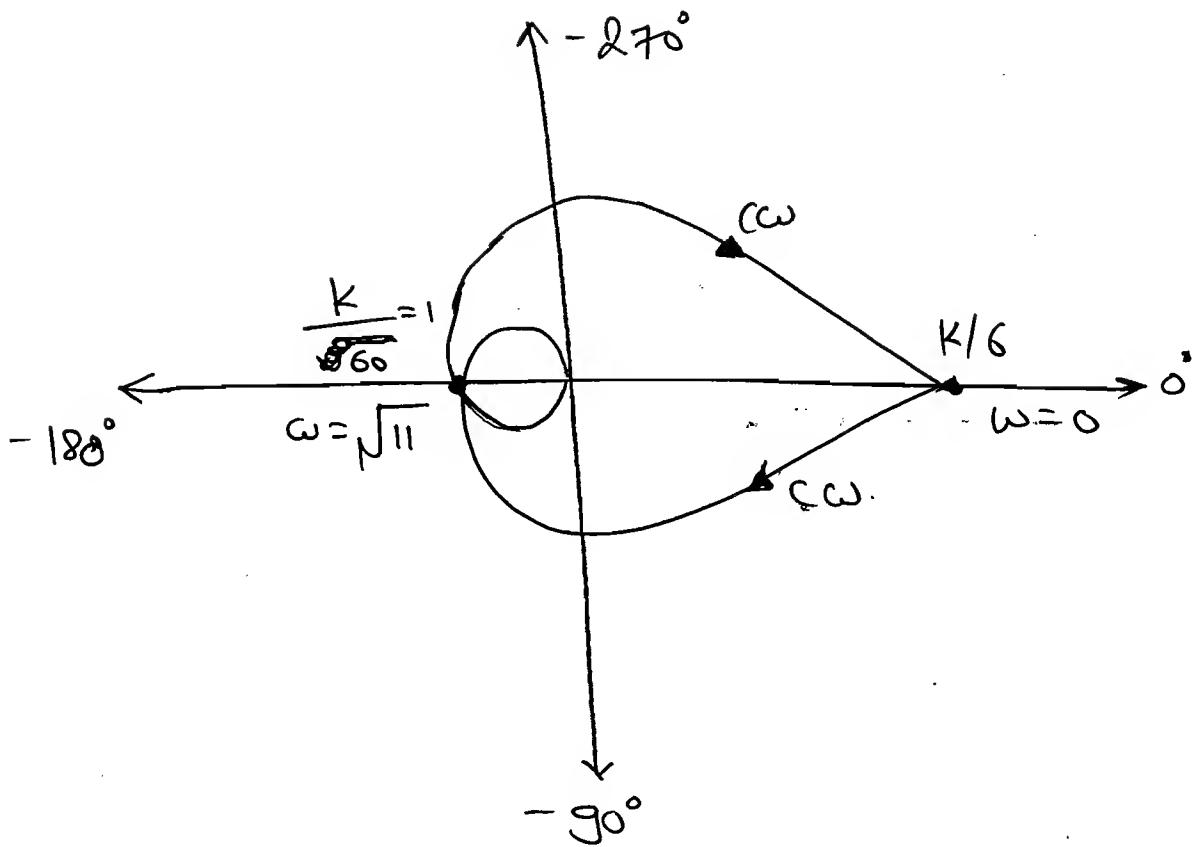

$$\phi = -\tan^{-1}(\omega) - \tan^{-1}(\omega_2) - \tan^{-1}(\omega_3)$$

$$\omega = 0 \Rightarrow M = \frac{K}{\sqrt{36}} = \frac{K}{6}, \quad \phi = 0^\circ$$

$$\omega = \infty \Rightarrow M = 0, \quad \phi = -270^\circ$$

$$E.P \Rightarrow \phi_1 - \phi_2 = +90^\circ = \omega$$

$$S.O \Rightarrow f.P = C\omega$$

\Rightarrow I.P. with -180° axis is $\frac{K}{\cancel{60}} = \frac{K}{60}$.

* Procedure to find the range of k values:-

S1: Assume that the I.P. with -180° must be equal to the critical point, that means the mag. of I.P. = Mag of critical point
i.e. Mag. $M=1$

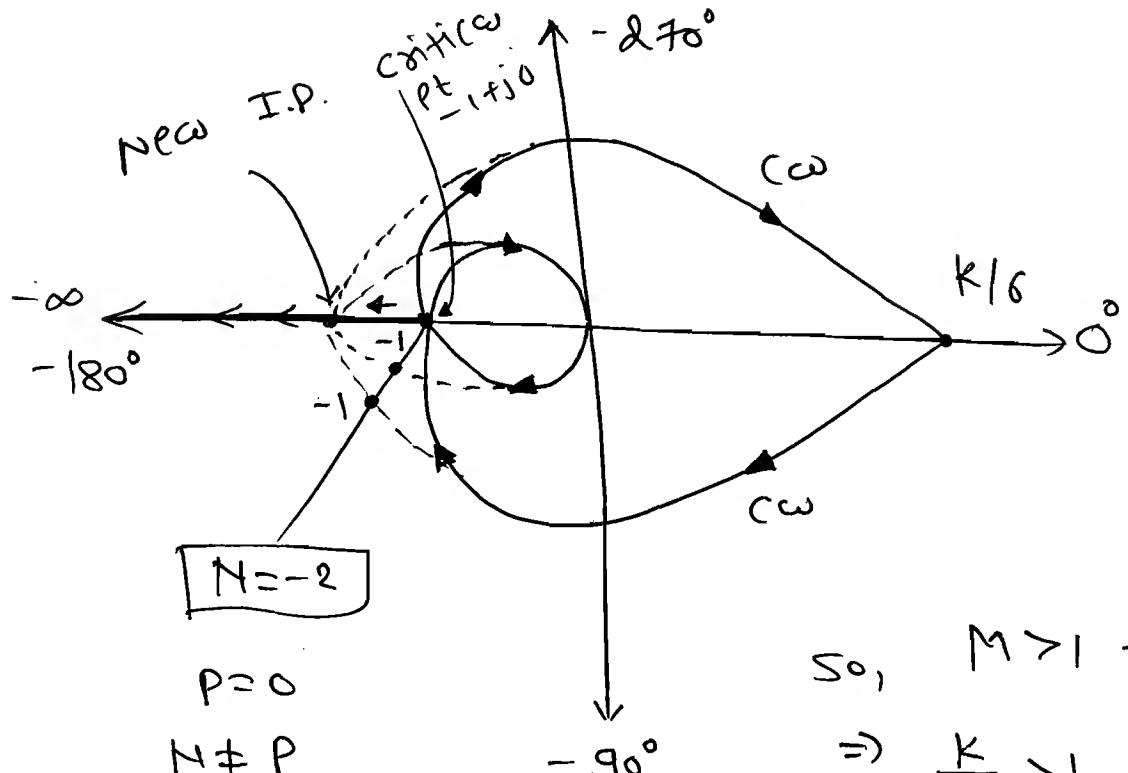

\Rightarrow In the above case $K/60=1$.

S2 : Shift the I.P. towards $-\infty$ by Considering $M>1$.

\Rightarrow In this case, the critical point inside the loop. For this get the no. of

encirclement & Condition for stability.

\Rightarrow

$S_0, M > 1 \rightarrow US$

$$\Rightarrow \frac{K}{60} > 1$$

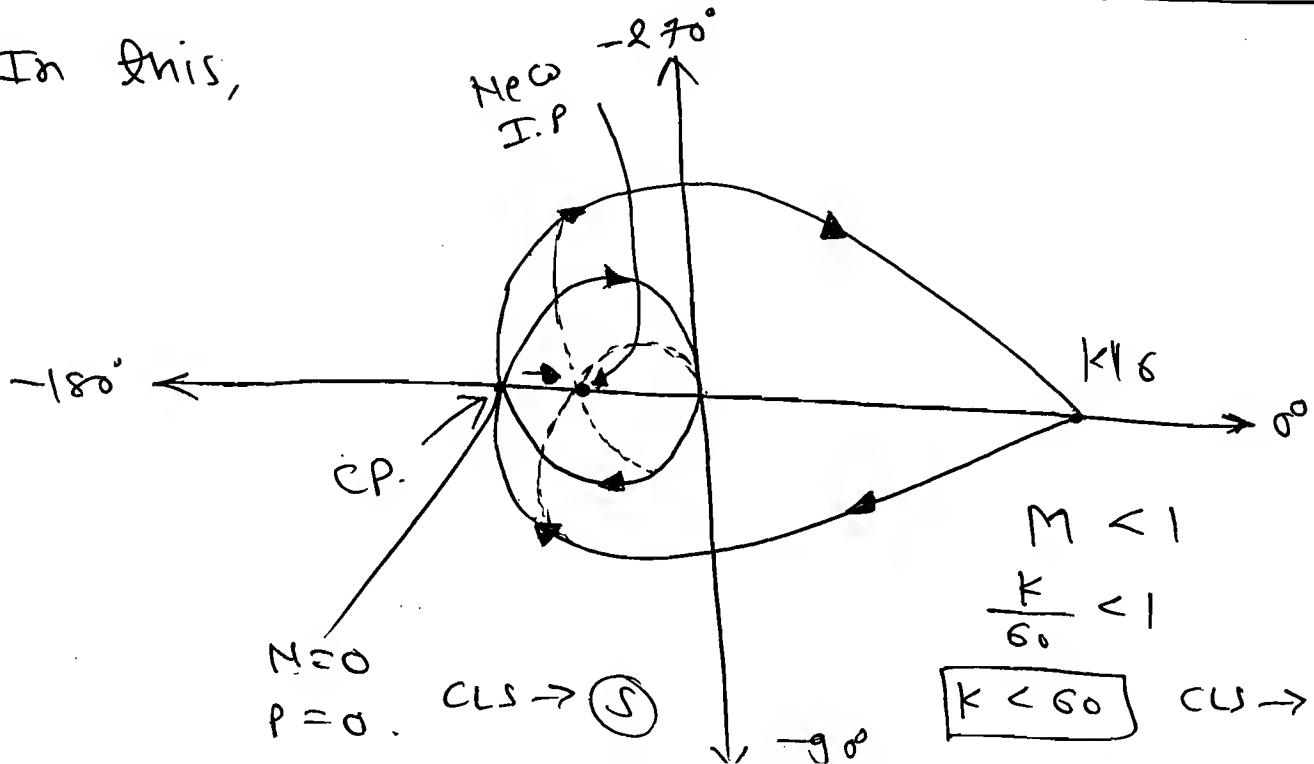

$$\Rightarrow K > 60 \Rightarrow OS$$

$$N = P - 2 \Rightarrow -2 = 0 - Z$$

$\Rightarrow Z = 2 \rightarrow CL$ poles on RHS plane.

S3: Shift the intersection point forward the origin by considering $M < 1$.

\Rightarrow In this,

$$M < 1$$

$$\frac{K}{60} < 1$$

$$K < 60$$

$CLS \rightarrow S$

(S4): Whenever the Stability Condition is less than certain value then the lower limit is decided by I.P. with 0° .

\Rightarrow The intersection Point with 0° must be greater than -1 .

\Rightarrow In the above problem $\frac{k}{6} > -1$.

$$\Rightarrow \boxed{k > -6}$$

So, $\boxed{-6 < k < 60} \Rightarrow$ stable system.

(Q) $G_{HCS} = \frac{k(s+3)}{s(s-1)}$.

Soln: $M = \frac{k \times \sqrt{\omega^2 + 9}}{\omega \times \sqrt{\omega^2 + 1}}$.

$$\Rightarrow \phi = -90^\circ + \tan^{-1}(\omega l_3) - 180^\circ + \tan^{-1}(\omega).$$

$$\phi = -270^\circ + \tan^{-1}(\omega) + \tan^{-1}(\omega l_3).$$

$$\Rightarrow \omega=0 \Rightarrow M=\infty, \phi = -270^\circ.$$

$$\Rightarrow \omega=\infty \Rightarrow M=0, \phi = -90^\circ.$$

$$E.O. \Rightarrow \phi_1 - \phi_2 = -\nu e \Rightarrow \text{Acc.}$$

$\underline{\underline{S:O}}$ X.

\Rightarrow I.P. with -180° .

$$\therefore -180^\circ = -270^\circ + \tan^{-1} \left(\frac{\omega + \omega l_3}{1 - \omega^2 l_3} \right).$$

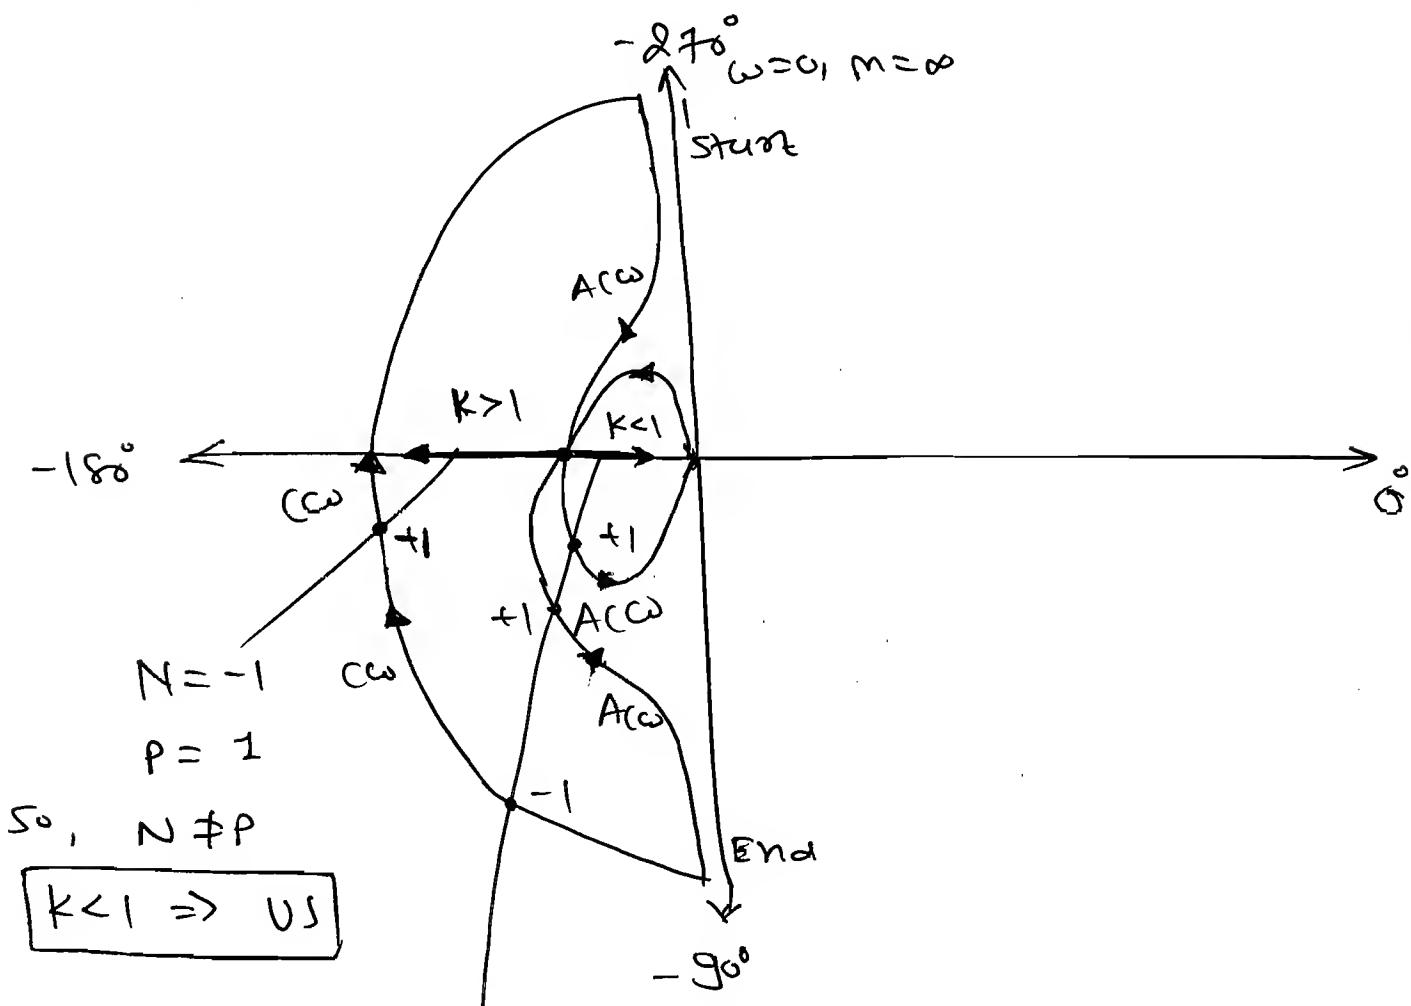

$$\therefore 90^\circ = \tan^{-1} \left(\frac{4\omega}{3 - \omega^2} \right).$$

$$\Rightarrow \omega = \sqrt{3} \text{ rad/sec.}$$

$$\Rightarrow M \Big|_{\omega=\sqrt{3}} = \frac{k \sqrt{3+9}}{(\sqrt{3})^2 \times \sqrt{3+1}}$$

$$= \frac{k \cancel{(8)}}{\sqrt{3} \times 2} \times \frac{k \sqrt{12}}{k \sqrt{3}} = \frac{k \times 2\sqrt{3}}{2\sqrt{3}} = k.$$

$$\boxed{M \Big|_{\omega=\sqrt{3}} = k}$$

$$\boxed{k < 1 \Rightarrow U.S.}$$

$$N = +1 + 1 - 1 = +1$$

$$N = +1, \quad P = +1.$$

$$\text{So, } \boxed{N = P} \Rightarrow \text{CLS } \textcircled{S}. \quad \boxed{k < 1}$$

No I.P. with 0°

$$\text{So, } \boxed{0 < k < 1 \Rightarrow \text{CLS } \textcircled{S}}.$$

$$\textcircled{a} \quad G(s) \cdot H(s) = \frac{K(s+2)}{(s+1)(s-1)} \Rightarrow \boxed{P=+1}$$

Soln: $M = \frac{K \sqrt{\omega^2 + 4}}{\sqrt{\omega^2 + 1} \times \sqrt{\omega^2 + 1}}$

$$\phi = -\cancel{\tan^{-1}\omega} + \tan^{-1}(\omega_2) - 180^\circ + \cancel{\tan^{-1}\omega}$$

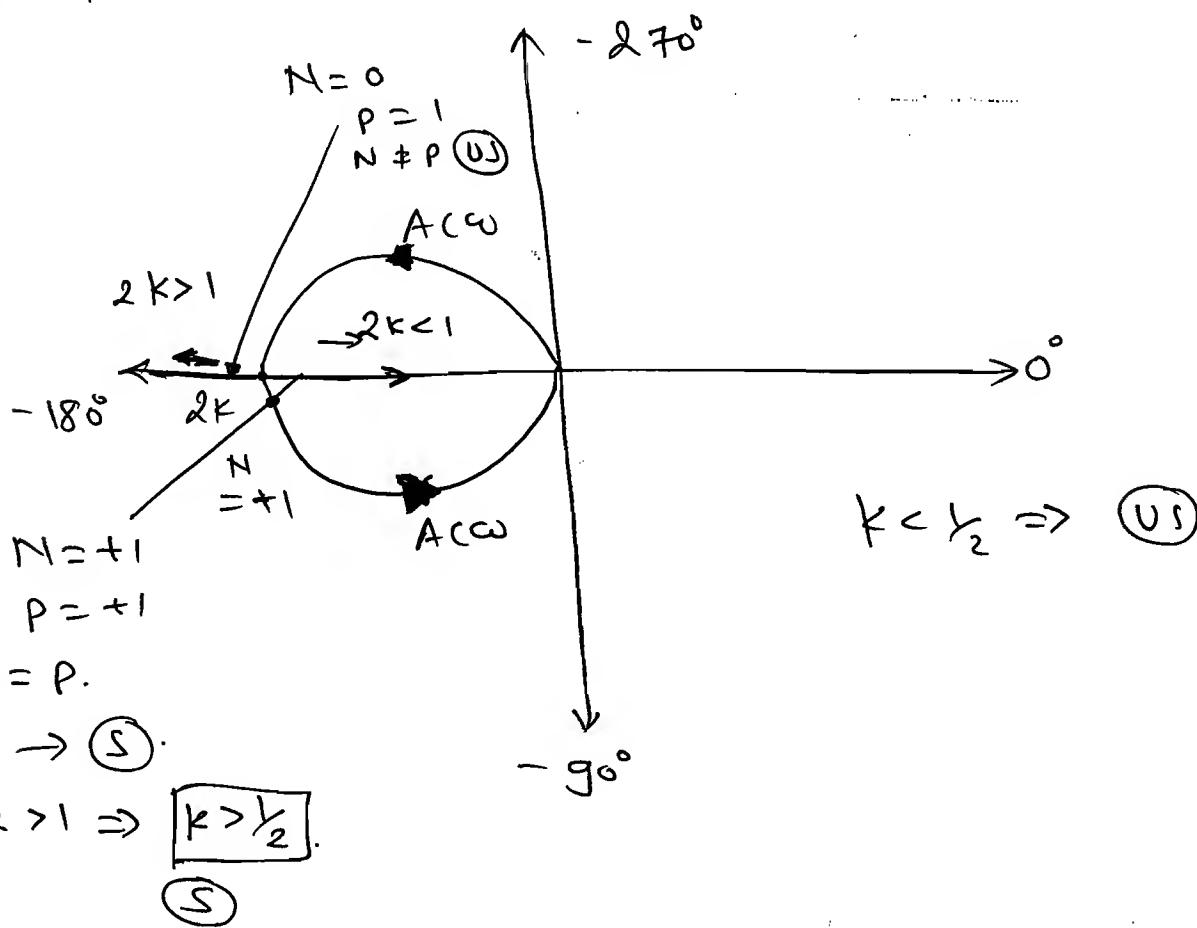

$$\phi = -180^\circ + \tan^{-1}(\omega_2).$$

$$\omega=0 \Rightarrow M = 2K, \phi = -180^\circ$$

$$\omega=\infty \Rightarrow M = 0, \phi = -90^\circ$$

$$E.D. \Rightarrow \phi_1 - \phi_2 = -ve \Rightarrow A(\omega)$$

S.D. X.

$$\textcircled{b} \quad G(s) \cdot H(s) = \frac{K(s-2)}{(s+2)}$$

Soln: $M = \frac{K \sqrt{\omega^2 + 4}}{\sqrt{\omega^2 + 4}} = K$

$$\Rightarrow \phi = -\tan^{-1}(\omega_1 z) + 180^\circ - \tan^{-1}(\omega_2 z)$$

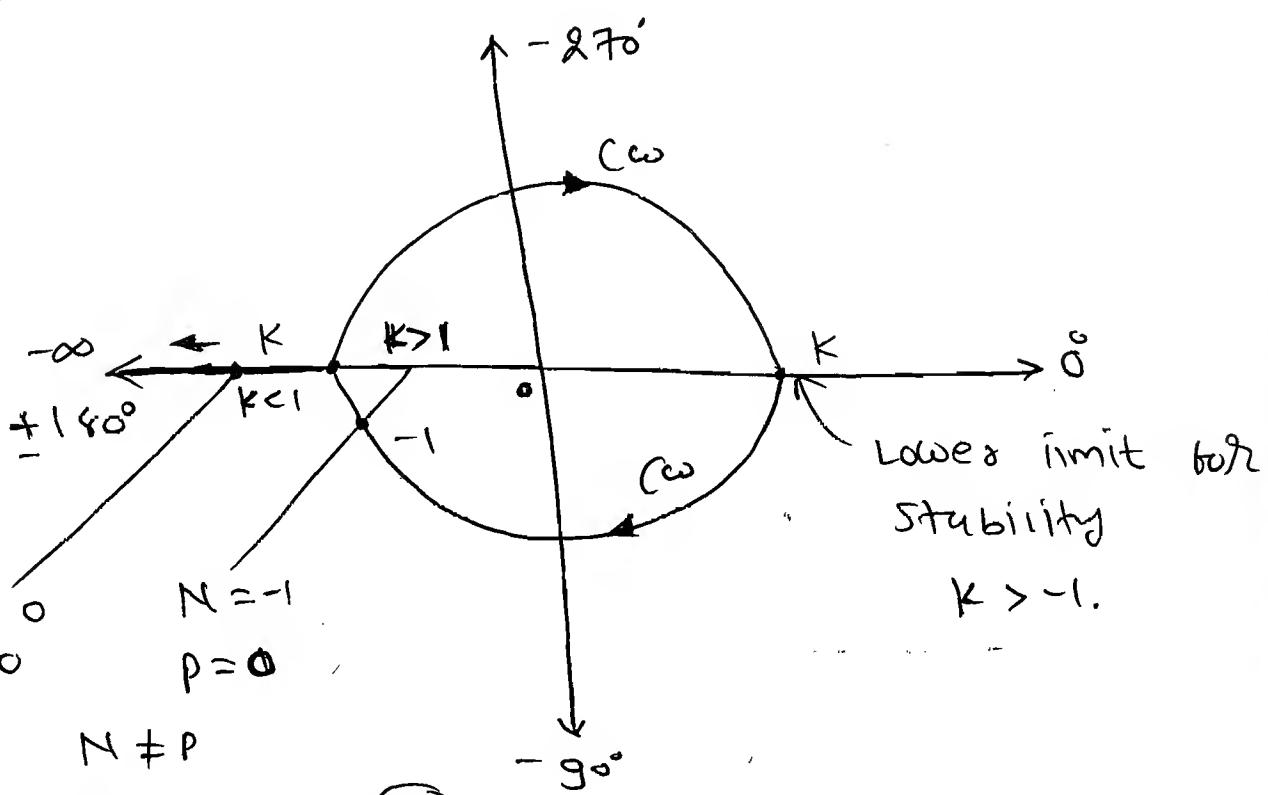

$$\phi = 180^\circ - 2 \tan^{-1}(\omega_1 z).$$

$$\omega=0 \Rightarrow M=K, \text{ and } \phi_1 = +180^\circ$$

$$\omega=\infty \Rightarrow M=K, \text{ and } \phi = 180^\circ - 2(90^\circ) \\ \phi_2 = 0^\circ$$

$$\Rightarrow \text{R.D.} \Rightarrow \phi_1 - \phi_2 = 180^\circ - \delta = +\text{ve} = CCW.$$

S.D. X.

$$\therefore -1 < K < 1 \Rightarrow CL \rightarrow \boxed{S}$$

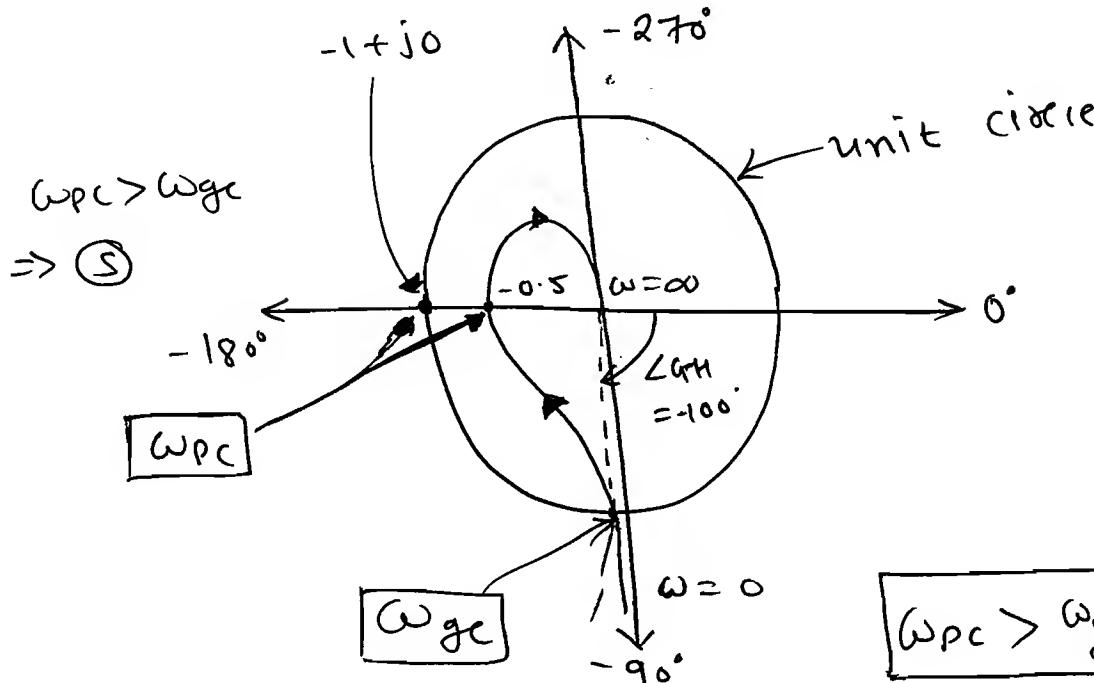

* GM & PM:

$$\Rightarrow GM = \frac{1}{M|_{\omega=\omega_{pc}}}$$

$$\Rightarrow PM = 180^\circ + \angle G_H|_{\omega=\omega_{ge}}$$

Q Identify the Stability to the following polar plots:

①

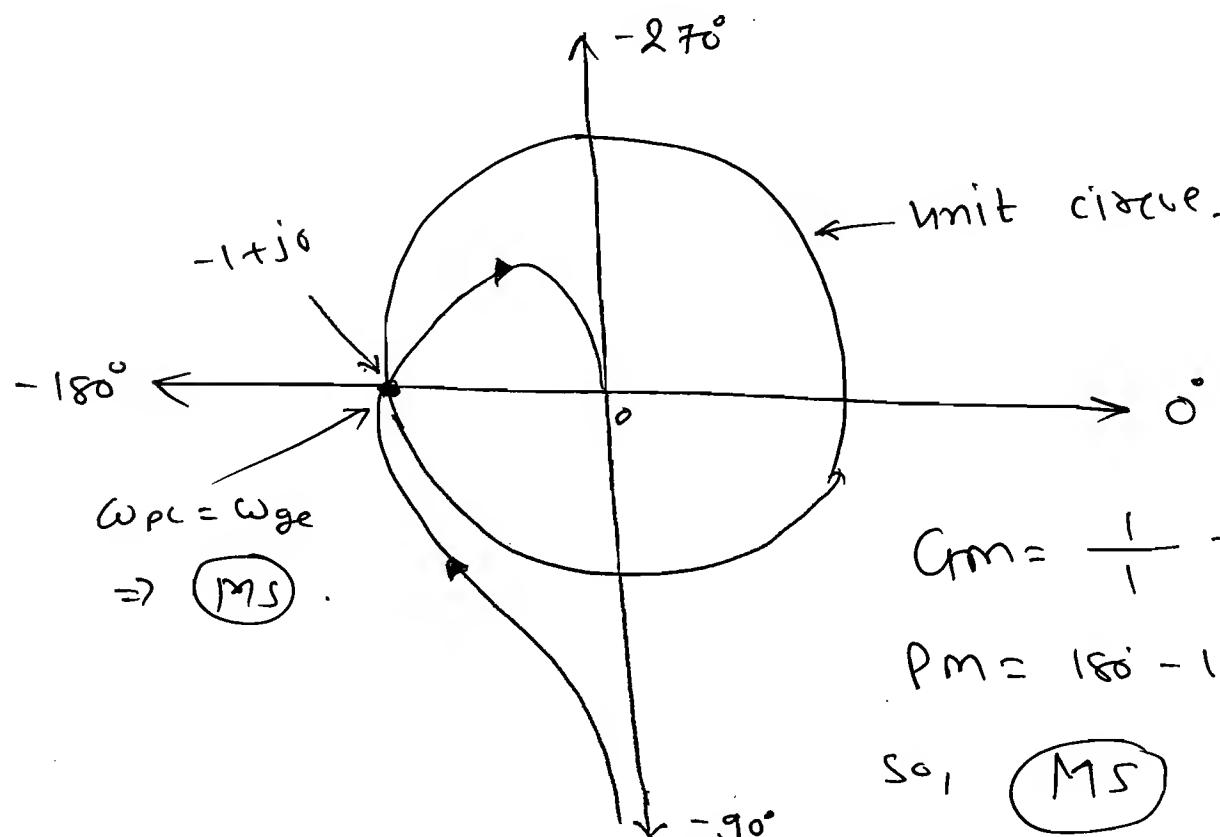

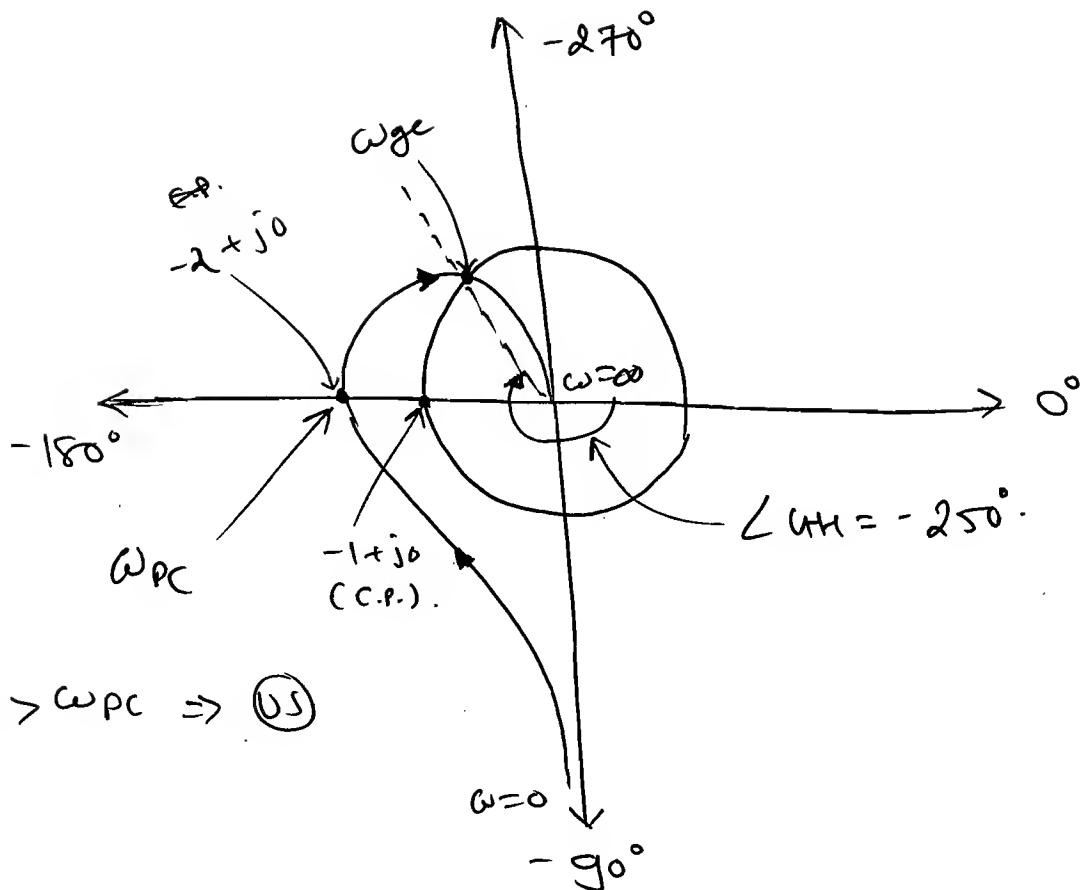

$$\Rightarrow GM = \frac{1}{M|_{\omega=\omega_{pc}}} = \frac{1}{0.5} = 2 > 1 \text{ (L)}$$

$$PM = 180^\circ + \angle GM = 180^\circ + (-100^\circ) = +80^\circ > 0$$

So, CL system $\rightarrow S$.

②

$\omega_{ge} > \omega_{pc} \Rightarrow \text{US}$

$$\Rightarrow GM = \frac{1}{M|_{\omega=\omega_{pc}}}$$

$$= \frac{1}{2} = 0.5 < 1 \quad L \quad \text{US}$$

$$\Rightarrow PM = 180^\circ + \angle \text{CH} = 180^\circ - 250^\circ = -70^\circ < 0$$

So, CLS \rightarrow US.

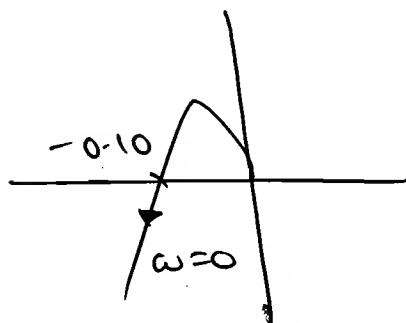

Note:

(i) Whenever the plot intersect -180° line with mag. less than 1 (i.e. $M < 1$), the sys. is **stable** because here $\omega_{pc} > \omega_{ge}$.

(ii) Whenever the plot intersect -180° line with mag. $M = 1$, then the sys. is **marginal stable** because here $\omega_{pc} = \omega_{ge}$.

(iii) Whenever the plot intersect -180° line with mag. $m > 1$ then the sys. is **unstable** because here $\omega_{ge} > \omega_{pc}$.

Q The polar plot of $G(s) \cdot H(s)$ for $K=10$ is given below. The range of K for sys. stability is.?

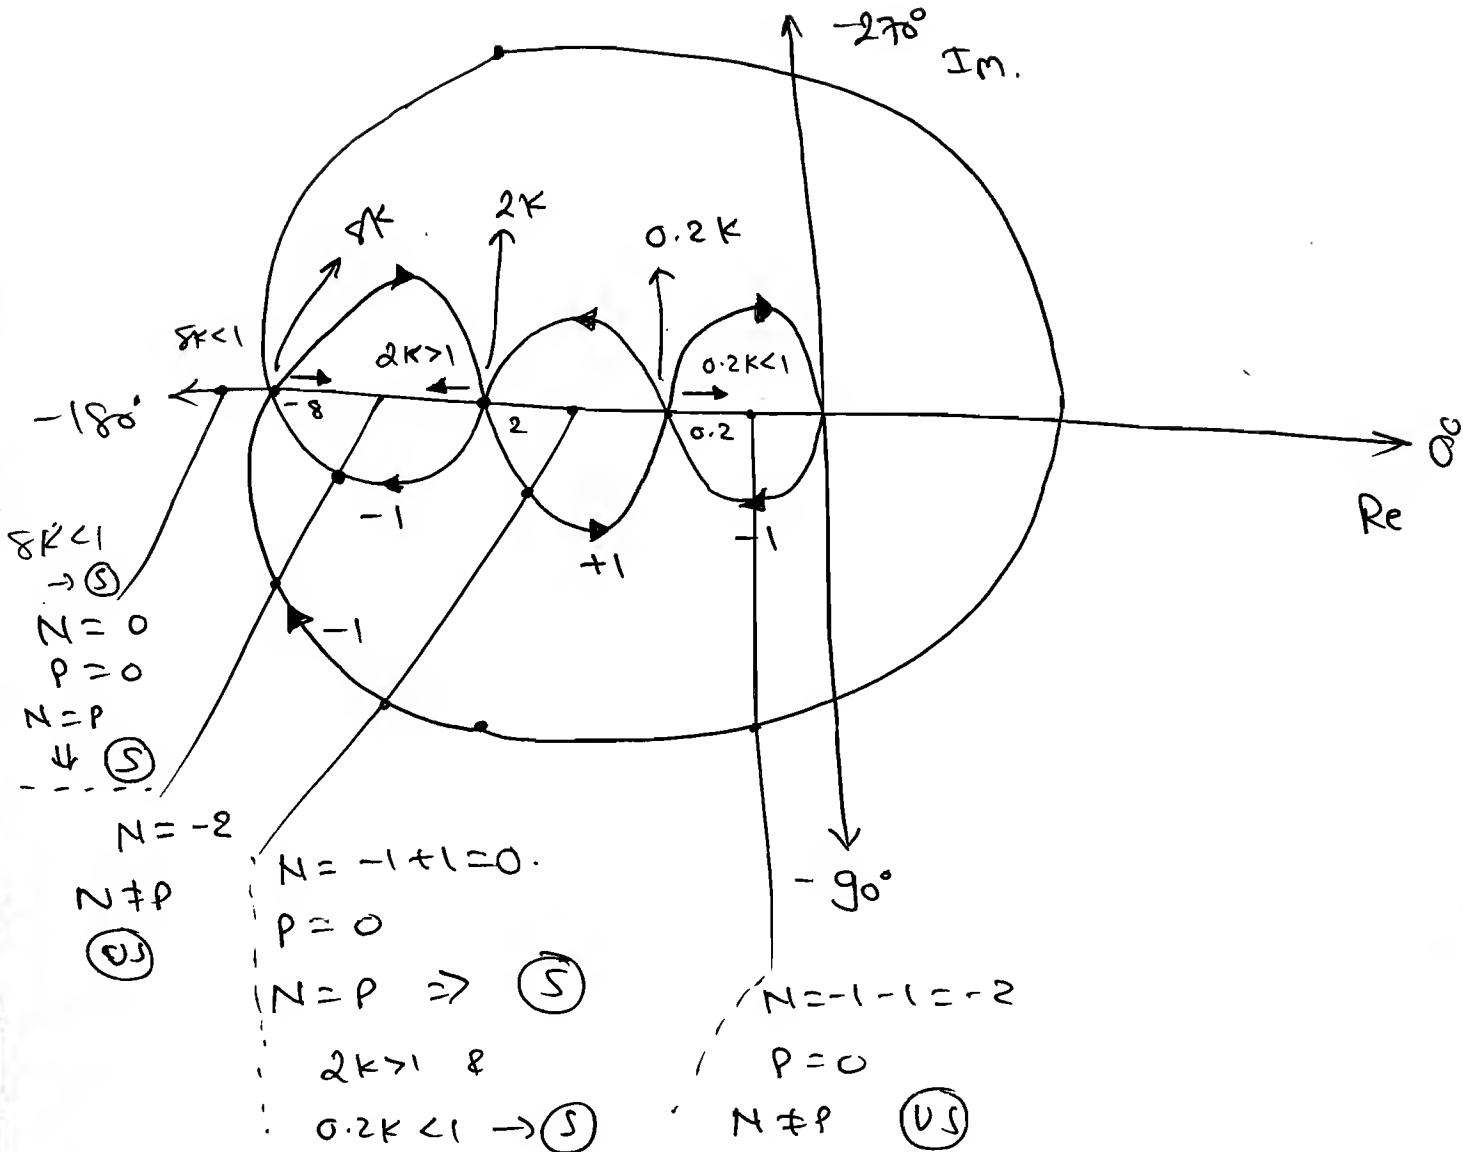

Soln: Note: To find the range of K value, product the K with given I-P. divided by given K value. (i.e here 10).

$$\text{So, For CLS to be } \textcircled{S} \quad K \cdot \frac{0.10}{10} < 1.$$

$$\therefore K < 100$$

Q The polar diagram of a Conditionally Stable sys. for open loop gain $K=1$ is given is shown in the fig. The OLTF of the sys. is known to be stable. The CL system stable for ?

① OL \textcircled{S}

$$\xrightarrow{\text{OL RH}} \boxed{P=0}$$

$$0.2K < 1$$

$$\frac{K}{5} < 1$$

$$\boxed{K < 5}$$

?

$$2K > 1$$

$$\boxed{K > 0.5}$$

$$\boxed{0.5 < K < 5} \Rightarrow \textcircled{S}$$

②

$$\rightarrow 8K < 1 \Rightarrow \boxed{K < \frac{1}{8}} \Rightarrow \textcircled{S}$$

So, Ans:

$$\boxed{K < \frac{1}{8} \& 0.5 < K < 5 \Rightarrow \textcircled{S}}$$

* Consider the following Nyquist plots of loop T.F. over $\omega = 0$ to $\omega = \infty$, which of the following plots represents stable closed loop sys.?

* Calculation of Gain Margin & Phase Margin:

(a) Calculate the gain margin for

$$G_H(s) = \frac{1}{s(s+1)(s+2)}$$

$\therefore M = \frac{1}{\omega \sqrt{\omega^2 + 1} \times \sqrt{\omega^2 + 4}}$

$$\phi = -90^\circ - \tan^{-1}\omega - \tan^{-1}(\omega_2)$$

Now, $G_m = \frac{1}{M|_{\omega=\omega_{pc}}}$

for ω_{pc} , $\phi|_{\omega=\omega_{pc}} = -180^\circ$.

$$\therefore -180^\circ = -90^\circ - \tan^{-1} \left(\frac{\omega_{pc} + \frac{\omega_{pc}}{2}}{1 - \frac{\omega_{pc}^2}{2}} \right)$$

$$\therefore \tan(90^\circ) = \frac{3\omega_{pc}}{2 - \omega_{pc}^2}$$

$\therefore \omega_{pc} = \sqrt{2}$ rad/sec.

Now, $M|_{\omega=\omega_{pc}} = \frac{1}{\sqrt{2} \sqrt{3} \sqrt{6}} = \frac{1}{6}$.

So, $G_m = \frac{1}{M|_{\omega=\omega_{pc}}} = \frac{1}{1/6} = 6$.

$\therefore G_m = 6$

$$G_m_{dB} = 20 \log 6 = 15.56 \text{ dB}$$

* Steps for finding Crm:

S1: find ω_{pc} by using $\angle \text{CH} = -18^\circ$.

S2: find $M |_{\omega=\omega_{pc}}$.

$$\boxed{\text{S3}} : \text{Crm.} = \frac{1}{M |_{\omega=\omega_{pc}}}.$$

Q Calculate the PM for $\text{CH}(s) = \frac{1}{s(s+1)}$

$$\text{Soln: } M = \frac{1}{\omega \sqrt{\omega^2 + 1}}, \quad \phi = -90^\circ - \tan^{-1}(\omega).$$

* Steps for finding PM:

S1: find $\omega_{ge} \rightarrow M=1$.

S2: $\text{PM} = 180^\circ + \angle \text{CH} |_{\omega=\omega_{ge}}$.

$$\Rightarrow M = 1 = \frac{1}{\omega \sqrt{\omega^2 + 1}}.$$

$$\Rightarrow \omega^2 (\omega^2 + 1) = 1$$

$$\omega^4 + \omega^2 - 1 = 0.$$

$$\therefore \omega^2 = 0.618 \checkmark, \quad \omega^2 = -1.618 \times$$

$$\therefore \boxed{\omega_{ge} = 0.786 \text{ rad/sec}}$$

$$\therefore \angle \text{CH} \Big|_{\omega=\omega_{ge}} = -90^\circ - \tan^{-1}(0.786).$$

$$\therefore \angle \text{CH} \Big|_{\omega=\omega_{ge}} = -128.17^\circ.$$

$$\therefore \text{PM} = 180^\circ + \angle \text{CH} \Big|_{\omega=\omega_{ge}} = 180^\circ - 128.17^\circ$$

$$\boxed{\text{PM} = 51.83}$$

(Q) find the K value to get the

$$PM = 30^\circ, \quad G(s) \cdot H(s) = \frac{K}{s(s+1)}.$$

Soln:

$$PM = 180^\circ + \angle \text{GH} \Big|_{\omega=\omega_{ge}}.$$

$$\therefore 30^\circ = 180^\circ + (-90^\circ - \tan^{-1}(\omega)).$$

$$\therefore -60^\circ = -\tan^{-1}(\omega_{ge}).$$

$$\omega = \tan 60^\circ$$

$$\therefore \boxed{\omega = \sqrt{3} \text{ rad/s.}}$$

$$\text{at } \omega = \omega_{ge}, M = 1.$$

$$\therefore M \Big|_{\omega=\omega_{ge}} = 1.$$

$$\therefore \frac{K}{\omega_{ge} \sqrt{\omega_{ge}^2 + 1}} = 1.$$

$$\therefore K = \sqrt{3} \times \sqrt{3+1} = 2\sqrt{3}.$$

$$\boxed{K = 2\sqrt{3}.}$$

(Q) (i) find the K value for the $PM=60^\circ$.

Soln:

$$G(s) \cdot H(s) = \frac{K}{s(s+2)(s+4)}.$$

$$\Rightarrow M = \frac{K}{\omega \sqrt{\omega^2+4} \times \sqrt{\omega^2+16}}.$$

$$\phi = -90^\circ - \tan^{-1}(\omega/2) - \tan^{-1}(\omega/4).$$

$$\Rightarrow PM = 180^\circ + \angle \text{GH} \Big|_{\omega=\omega_{ge}}.$$

$$\therefore 60^\circ = 180^\circ + (-g_0 - \tan^{-1}\left(\frac{\omega}{2}\right) - \tan^{-1}\left(\frac{\omega_{p1}}{4}\right))$$

$$\therefore -30^\circ = -\tan^{-1}\left(\frac{\frac{\omega}{2} + \frac{\omega}{4}}{1 - \frac{\omega^2}{8}}\right).$$

$$\therefore \frac{1}{\sqrt{3}} = \frac{6\omega}{8 - \omega^2}.$$

$$8 - \omega^2 = 8\sqrt{3}\omega \cdot 6\sqrt{3}\omega$$

$$\therefore -\omega^2 + \frac{6}{\sqrt{3}}\omega + 8 = 0.$$

$$\therefore -\omega^2 - 6\sqrt{3}\omega + 8 = 0$$

$$\Rightarrow \boxed{\omega_{ge} = 0.72 \text{ rad/sec.}}$$

Now $M \Big|_{\omega=\omega_{ge}} = 1.$

$$\therefore \frac{k}{0.72 \sqrt{(0.72)^2 + 4}} \times \sqrt{(0.72)^2 + 16} = 1.$$

$$\therefore \boxed{k = 4.456}$$

(ii) find the k value to get $G_m = 20 \text{ dB}$.

$$\text{So } G_m = \frac{1}{M \Big|_{\omega=\omega_{pc}}}$$

$$\text{given } G_m = 20 \text{ dB} \Rightarrow G_m = 10 \log(G_m)$$

$$G_m = 20.$$

$$\therefore \text{for } \omega_{pc} \quad \phi = -180^\circ.$$

$$\therefore -180^\circ = -g_0 - \tan^{-1}\left(\frac{\omega_{pc}}{2}\right) - \tan^{-1}\left(\frac{\omega_{p1}}{4}\right).$$

$$\therefore 90^\circ = \tan^{-1} \left(\frac{\frac{\omega}{2} + \frac{\omega}{4}}{1 - \frac{\omega^2}{8}} \right)$$

$$\therefore 1 - \frac{\omega^2}{8} = 0$$

$$\omega_{pc} = \sqrt{8} \text{ rad/sec}$$

$$\Rightarrow G_m = \frac{1}{M |_{\omega = \omega_{pc}}}$$

$$\therefore 10 = \left(\frac{K}{\sqrt{8} \times \sqrt{8+4} \times \sqrt{8+16}} \right)^{-1}$$

$$\therefore 0.1 = \frac{K}{\sqrt{8} \times \sqrt{12} \times \sqrt{24}}$$

$$\therefore K = 48 \times 0.1$$

$$\therefore K = 4.8$$

(Q) The OLT of unity Hb sys. is $G(s) = \left(\frac{as+1}{s^2} \right)$, the value of 'a' to get the PM = 45° .

$$\therefore M = \frac{\sqrt{(a\omega)^2 + 1}}{\omega^2}$$

$$\phi = -180^\circ + \tan^{-1}(a\omega)$$

$$PM = 180^\circ + \angle G_m |_{\omega = \omega_{gc}}$$

$$\therefore 45^\circ = 180^\circ - 180^\circ + \tan^{-1}(a\omega)$$

$$\therefore 1 = a\omega \Rightarrow$$

$$\omega_{gc} = \gamma_a$$

$$\Rightarrow M \Big|_{\omega=\omega_{gc}} = 1.$$

$$\Rightarrow \frac{\sqrt{1 + \frac{\alpha^2 \times \frac{1}{\alpha^2}}{\alpha^2}}}{\alpha^2} = 1.$$

$$\therefore \alpha^2 = \frac{1}{\sqrt{2}}.$$

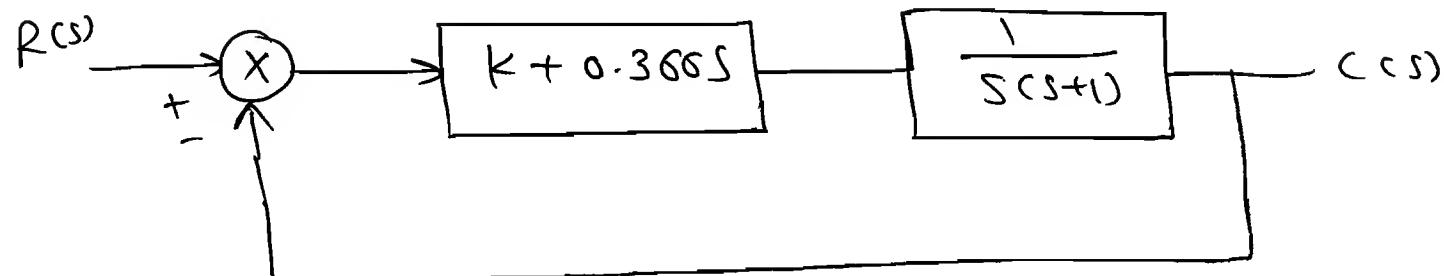

$$\therefore \alpha^4 = \frac{1}{2}.$$

$$\alpha = (\alpha)^{-\frac{1}{4}}.$$

$$\therefore \boxed{\alpha = 0.8408.}$$

(c) If the component connected sys

as shown in fig. has pm of 60° at
a cross over freq. of 1 rad/sec, the
value of R is ____.

$$\text{Soln: OLTG } \frac{C(s)}{R(s)/2} = \frac{(K + 0.366s)}{s(s+1)}$$

$$PM = 180^\circ + \angle G_H \Big|_{\omega=1 \text{ rad/sec.}}$$

$$\therefore 45^\circ = 180^\circ + (-90^\circ - \tan^{-1}(\omega_{gc}) + \tan^{-1}\left(\frac{0.366\omega}{K}\right)).$$

\Rightarrow ~~case~~

$$\therefore \tan^{-1}(\omega) - \tan^{-1}\left(\frac{0.366\omega}{K}\right) = 30^\circ.$$

$$\therefore \tan^{-1}(1) - \tan^{-1}\left(\frac{0.366\omega}{K}\right) = 30^\circ.$$

$$\therefore 45^\circ - \tan^{-1}\left(\frac{0.366}{K}\right) = 30^\circ.$$

$$15^\circ = \tan^{-1}\left(\frac{0.366}{K}\right).$$

$$0.268 = \frac{0.366}{K}$$

$$\boxed{K = 1.366}$$

Note: To calculate G_m & P_m required
OLTF of either unity (or) N_m -
unity b/w sys. i.e $G(s)$ (or) $G(s)-H(s)$.

Q The loop gain of a Nyquist plot

$$G_H(s) = \frac{\pi e^{-j0.25s}}{s} \quad \text{passes through the}$$

real axis at the point is ____.

Soln: Passing through the -ve real axis
means it is a I.P. with -180° . i.e.
mag. at wpc.

$$\therefore \angle G_H(s) = -180^\circ = -90^\circ - 0.25\omega \times \frac{180^\circ}{\pi}$$

$$\therefore 0.25 \times \omega \times \frac{180^\circ}{\pi} = 90^\circ$$

$$\therefore 0.25 \times \omega \times \frac{180^\circ}{\pi} = 90^\circ$$

$$\therefore \omega_{gc} = \cancel{\frac{\pi}{0.5}} \quad \omega_{pc} = \frac{\pi}{0.5} = 2\pi$$

$$\therefore \boxed{\omega_{pc} = 6.28 \text{ rad/sec}}$$

$$\therefore M \Big|_{\omega=\omega_{pc}} = \frac{\pi}{2\pi} = \frac{1}{2} = 0.5^\circ$$

$$\boxed{I.P.E. Rec(-0.5, j0).}$$

Polar $\Rightarrow 0.5 \angle 0^\circ$

(a) Calculate the Crm & Pm to the above sys.

$$\underline{\text{Soln:}} \quad G_m = \frac{1}{M} \Big|_{\omega=\omega_{pc}}$$

$$= \frac{1}{0.5}$$

$$\Rightarrow \boxed{C_m = 2}$$

for ω_{ge} $M = 1$.

$$\therefore \frac{\pi}{\omega} = 1 \Rightarrow \boxed{\omega_{ge} = \pi}$$

$$\therefore P_m = 180^\circ + (-90^\circ - 0.25 \times \pi \times \frac{180}{\pi})$$

$$\boxed{P_m = 45^\circ}$$

(a) Calculate the Crm & Pm for $G_H(s) = \frac{e^{-j}}{s(s+1)}$.

$$\underline{\text{Soln:}} \quad s \rightarrow j\omega$$

$$G_H(j\omega) = \frac{e^{-j\omega}}{j\omega(j\omega+1)}$$

$$M = \frac{1}{\omega \sqrt{\omega^2 + 1}}$$

$$\phi = -g_0 - \tan^{-1}(\omega) - \omega \times \frac{\pi}{180} \cdot \frac{180}{\pi}$$

$\angle \alpha_m = -180^\circ$ at $\omega = \omega_{pc}$.

$$\therefore -180^\circ = -g_0 - \tan^{-1}(\omega) - \omega \times \frac{\pi}{180} \cdot \frac{180}{\pi}.$$

$$\therefore g_0 = \tan^{-1}(\omega) + \frac{\omega \times \pi}{180} \cdot \frac{180}{\pi}.$$

$$\therefore \tan^{-1}(\omega) + 57.3\omega - g_0 = 0.$$

$$\Rightarrow \boxed{\omega_{pc} = 0.86 \text{ rad/sec}}$$

$$C_m = \frac{1}{m|_{\omega=\omega_{pc}}}.$$

$$= \frac{1}{\frac{1}{0.86 \sqrt{0.86^2 + 1}}}$$

$$\boxed{C_m = 1.13}$$

In calculator,
write eqn i.e.

$$\tan^{-1}(x) + 57.3(x) - g_0$$

then press shift
+ CALC.

$$\Rightarrow \text{Now, } PM, \quad m|_{\omega=\omega_{ge}} = 1.$$

$$\therefore \frac{1}{\omega_{ge} \sqrt{\omega_{ge}^2 + 1}} = 1.$$

$$\therefore \omega_{ge}^2 (\omega_{ge}^2 + 1) - 1 = 0$$

$$\Rightarrow \boxed{\omega_{ge} = 0.786 \text{ rad/sec.}}$$

$$\therefore PM = 180^\circ + \angle \alpha_m|_{\omega=\omega_{ge}}.$$

$$\therefore PM = 180^\circ + (-g_0 - \tan^{-1}(0.786) - (0.786 \times \frac{180}{\pi}))$$

$$\therefore \boxed{PM = 6.8^\circ}$$

Calculate Cm & Pm $G_H(s) = \frac{1}{(s+2)}$.

Soln: $M = \frac{1}{\sqrt{\omega^2 + 4}}$, $\phi = -\tan^{-1}(\omega l_2)$.

$\Rightarrow -180^\circ = -180^\circ + \left(\text{at } \omega = \omega_{pc}\right).$

$\therefore -180^\circ = 180^\circ - \tan^{-1}(\omega l_2)$.

$\therefore \tan^{-1}\left(\frac{\omega l_2}{2}\right) = 360^\circ$.

$\therefore \angle C_m = -180^\circ \text{ at } \omega = \omega_{pc}$.

$\therefore -180^\circ = -\tan^{-1}\left(\frac{\omega_{pc}}{2}\right)$.

$\therefore \frac{\omega_{pc}}{2} = \tan(180^\circ)$.

$\therefore \frac{\omega_{pc}}{2} = 0^\circ$.

** * One Pole can give max angle 90°
i.e. ω varies from 0 to ∞ angle
will varies from 0 to 90° .

So, $\boxed{\omega_{pc} = \infty}$ rad/s.

$\Rightarrow P_m = 180^\circ - \tan^{-1}(\omega l_2)$.

$\therefore M = \frac{1}{\sqrt{\omega^2 + 4}} \quad \left| \begin{array}{l} \omega = \omega_{pc} \end{array} \right.$

$= \frac{1}{\infty}$

$\therefore \boxed{M=0}$

$\Rightarrow C_m = \frac{1}{M \mid \omega = \omega_{pc}} = \frac{1}{0} \Rightarrow \boxed{C_m = \infty}$

$$\Rightarrow M \Big|_{\omega=\omega_{ge}} = 1.$$

$$\therefore \frac{1}{\sqrt{\omega^2 + 4}} = 1. \Rightarrow \omega_{ge} = -3$$

$\omega_{ge} = \pm \sqrt{3} \times \text{In vaild.}$

$$\rightarrow \omega = 0 \rightarrow \frac{m}{0.5}$$

$$\omega = \infty \rightarrow 0.$$

So, one pole give max mag. 0.5.

$M < 1$ $\rightarrow \omega_{ge}$ does not exist.

$$\boxed{P_m = \infty}$$

Note:

\Rightarrow Whenever the plot (or) T-F. gives less mag. than 1 (i.e.) $m < 1$ & -ve phase angle than -180° at all the freq. range then the $C_m = P_m = \infty$. (ω_{pc}, ω_{ge} does not exist).

$C_H = Y_S$.

Soln: $M = Y_\omega, \phi = -90^\circ$.

C_m $\rightarrow \omega_{pc} \angle C_H = -180^\circ$
 $-90^\circ = -180^\circ \times$

$\angle -180^\circ$ $\rightarrow \omega_{pc} = \infty$.

$m \Big|_{\omega=\omega_{pc}} = 0 \Rightarrow$

$\boxed{C_m = \infty}$

$$\frac{PM}{\omega_{ge}} \Rightarrow m = 1$$

$$\frac{1}{\omega_{ge}} = 1 \Rightarrow \omega_{ge} = 1 \text{ rad/sec}$$

$$\therefore PM = 180^\circ - 90^\circ$$

$$PM = 90^\circ$$

Stable

Note:

$M < 1$, $\phi < -180^\circ$, $\omega_{ge} \& \omega_{pc} = \text{doesn't exist}$

$$C_m = PM = \infty$$

options:

- ① $PM = \infty \rightarrow 1^{\text{st}}$ priority.
- ② None $\rightarrow 2^{\text{nd}}$ priority.
- ③ $\omega_{ge} = 0 \& \text{ calculate } PM \rightarrow \text{last priority.}$

$C_m = \frac{1}{s^2}$.

Soln: $M = \frac{1}{\omega^2}, \quad \phi = -180^\circ$.

$$\therefore \angle C_m = -180^\circ$$

$$m = 1$$

$$\angle C_m | \omega = \omega_{pc} = -180^\circ$$

$$\frac{1}{\omega_{ge}^2} = 1$$

$$-180^\circ = -180^\circ$$

$$\omega_{pc} = \omega_{ge}$$

$$\omega_{ge} = \omega_{pc} = 1 \text{ rad/sec}$$

$$\Rightarrow M | \omega = \omega_{pc} = 1/1 = 1.$$

\Rightarrow MS

$$C_m = 1$$

①

$$PM = 180^\circ + \angle C_m | \omega = \omega_{ge}$$

$$C_m \text{ in dB} = 0 \text{ dB}$$

$$\frac{PM = 180^\circ - 180^\circ}{PM = 0^\circ}$$

(Q) $G_{H(s)} = \frac{1}{s^3}$.

So, 3: $M = \frac{1}{\omega^3}, \quad \angle M = \phi = -270^\circ$.

Cm $\angle Cm|_{\omega=\omega_{pc}} = -180^\circ$

$\therefore -270^\circ \neq -180^\circ$

$\Rightarrow \underline{-180^\circ} \omega_{pc} = 0.$

$Cm = \frac{1}{M|_{\omega=\omega_{pc}}} = \frac{1}{0} = 0.$

$Cm = 0 < 1$

(U.S)

Pm $\omega_{ge} \quad M = 1, \quad \Rightarrow \omega_{ge} = 1 \text{ rad/sec.}$

$Pm = 180^\circ - 270^\circ$

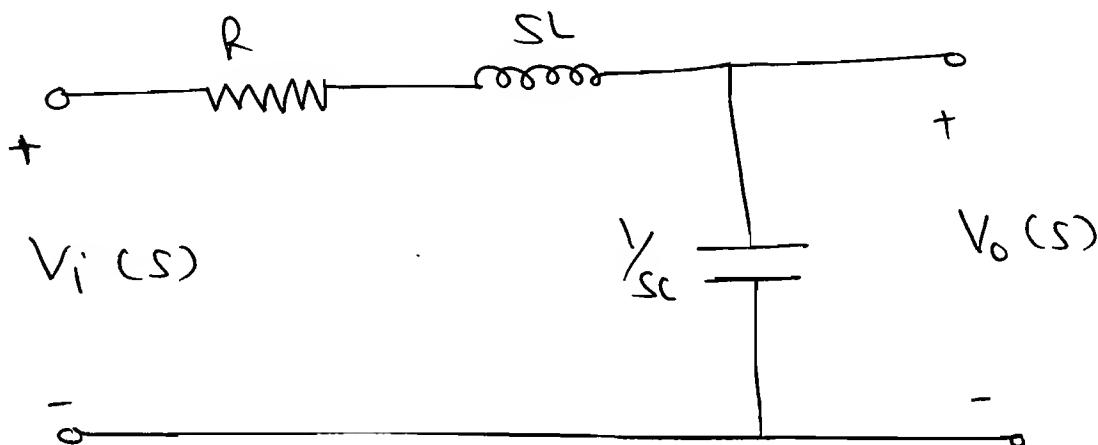

$\boxed{Pm = -90^\circ < 0} \Rightarrow$

(U.S)

So, CLS (U.S).

* Frequency Domain Specification:-

⇒ The general freq. response of RLC ckt is shown in fig.

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{\frac{1}{sC}}{R + sL + \frac{1}{sC}}$$

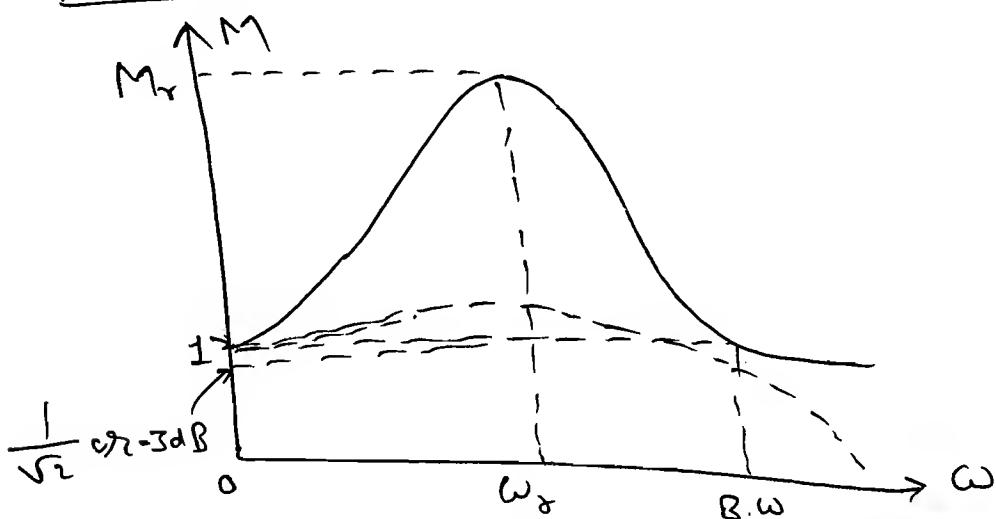

$$\frac{V_o(s)}{V_i(s)} = \frac{1}{s^2 + sR_L + \frac{1}{Lc}}$$

$$\therefore \omega_n = \frac{1}{\sqrt{LC}} \text{ rad/sec.}$$

$$2\zeta\omega_n = R/L.$$

$$\zeta = \frac{R}{2} \times \frac{1}{\sqrt{LC}}$$

$$\alpha = \frac{1}{2\zeta} = \frac{1}{R} \times \frac{1}{\sqrt{LC}}$$

* Resonant freq.:

⇒ It is a freq. at which max. magnitude occurs so,

$$\omega_r = \omega_n \sqrt{1 - 2\zeta^2} \text{ rad/sec}$$

* Resonant Peak:

⇒ It is a max. magnitude occurs at resonant freq.

$$M_r = \frac{1}{2\zeta \sqrt{1 - \zeta^2}}$$

⇒ $\zeta < \frac{1}{\sqrt{2}}$ * then freq. domain Specification is valid otherwise not valid.

⇒ when $\zeta \geq \frac{1}{\sqrt{2}}$, no resonant peak & No Resonant freq. exist.

* Band-width:-

⇒ It is the range of freq. at which the mag. dropped by $-3 \text{ dB (or) } \frac{1}{\sqrt{2}}$ from the maximum value at the low freq.

\Rightarrow BW for 1st order

$$BW = \frac{1}{\pi}$$

BW for 1st order.

\Rightarrow BW for 2nd order.

$$BW = \omega_n \sqrt{1 - 2\zeta^2 + \sqrt{2 - 4\zeta^2 + 4\zeta^4}}$$

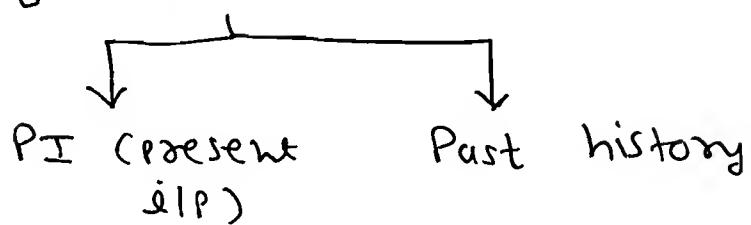

State

Space

Analysis:

\Rightarrow State \Rightarrow future behaviour

\Rightarrow The state gives the future behaviour of the sys. based on the present IIP & past history of the system.

\Rightarrow The past history (Initial condition) of the sys. described by the state variable.

\Rightarrow The resistive ckt not having any state variable, because the o/p does not depends on the past history of the system.

\Rightarrow The resistive ckt o/p depends on only i/p.

\Rightarrow The resistive ckt cannot store any energy i.e. No past history, no state variables.

\Rightarrow The resistive ckt is called memoryless system.

* No. of State Variables:

\Rightarrow If the RLC ckt given then the

No. of State Variable = Sum of
Inductors & Capacitors.

\Rightarrow If the differential eqn is given,

No. of State Variable = Order of diffⁿ
eqn.

* Standard form of State model:-

$$\begin{array}{c}
 \text{Diff}^n \rightarrow \dot{X} = AX + BU \rightarrow \text{State } \mathbb{C}^n | \text{ Dynamic } \\
 \text{state} \qquad \downarrow \qquad \downarrow \qquad \text{ } \\
 \text{vector} \qquad Y = CX + DU \rightarrow \text{Olp } \mathbb{C}^n \\
 \downarrow \qquad \qquad \qquad \downarrow \qquad \qquad \downarrow \\
 \text{Olp} \qquad \text{State} \qquad \text{IIP} \\
 \text{vector} \qquad \text{vector} \qquad \text{vector}
 \end{array}$$

$\Rightarrow A \rightarrow \text{State matrix}$

$B \rightarrow I/P$ matrix.

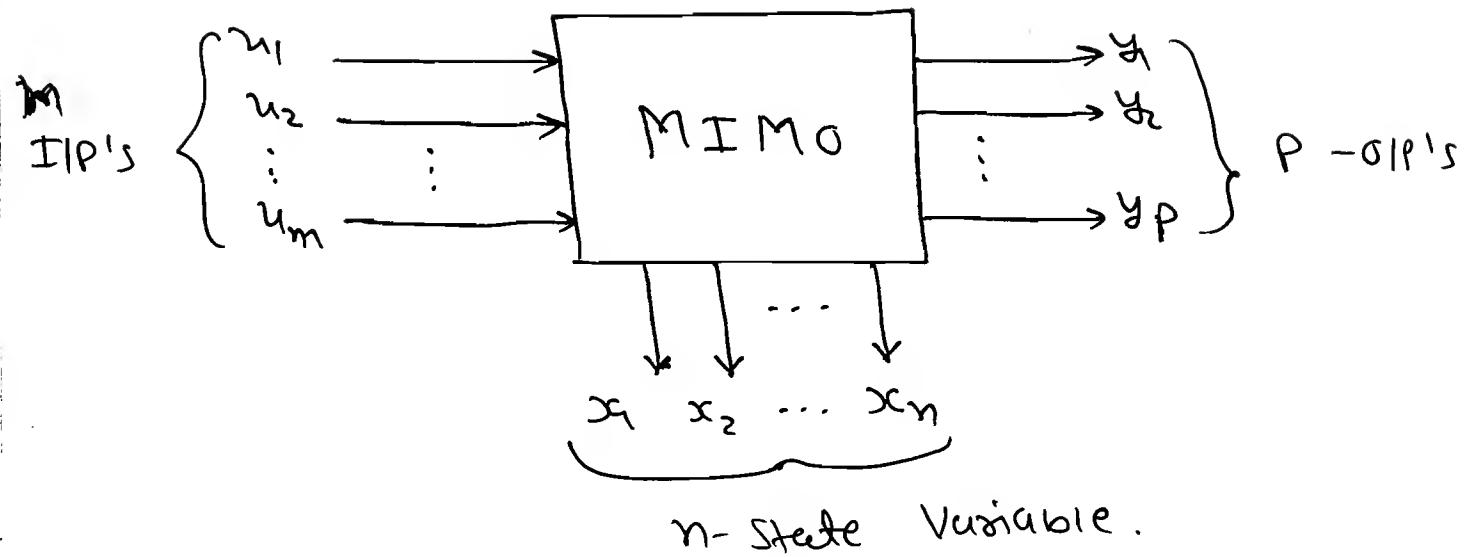

$C \rightarrow \text{QIP matrix}$

$D \rightarrow$ Transmission matrix.

* Order of Matrices:-

\Rightarrow Consider the multi-ILP, multi OLIP system as shown in fig.

\Rightarrow

\Rightarrow I/P Vector (u) =

$$\begin{bmatrix} u_1 \\ u_2 \\ \vdots \\ u_m \end{bmatrix}_{m \times 1}$$

\Rightarrow O/P Vector (y) =

$$\begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_p \end{bmatrix}_{p \times 1}$$

\Rightarrow State Vector (x) =

$$\begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}_{n \times 1}$$

\Rightarrow

$$\dot{x} = Ax + Bu$$

\downarrow \downarrow \downarrow
 nx_1 nx_1 mx_1
 \downarrow \downarrow \downarrow
 nxn $n \times m$

\Rightarrow The order of differential state vector must be equal to order of the state vector.

$$Y = CX + DU$$

↓ ↓ ↓
 $p \times 1$ $n \times 1$ $m \times 1$
 ↓ ↓
 $p \times n$ $p \times m$

* State Model to Differential eqn:-

Ques Write the State model to following systems:

① $\ddot{y} + 3\ddot{y} + 5\dot{y} + 7y = 10U$.

← S.C. with opposite sign of co-efficient required

Soln: The No. of state variable is 3, $n=3$

$$\text{Let, } y = x_1 \quad \text{--- ①}$$

$$\dot{x}_1 = \dot{y} = x_2 \quad \text{--- ②}$$

$$\dot{x}_2 = \ddot{y} = x_3 \quad \text{--- ③}$$

$$\dot{x}_3 = \cdots = \quad \text{--- ④.}$$

\Rightarrow To get the x_3 in terms of state variable substitute all eqn in the given sys.

$$\therefore \dot{x}_3 + 3x_3 + 5x_2 + 7x_1 = 10U.$$

$$\Rightarrow \dot{x}_3 = -7x_1 - 5x_2 - 3x_3 + 10U \quad \text{--- ⑤}$$

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -7 & -5 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 10 \end{bmatrix} [U].$$

$$[y] = [1 \ 0 \ 0] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

S.C.

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & \dots \\ 0 & 0 & 1 & 0 & \dots \\ 0 & 0 & 0 & 1 & \dots \end{bmatrix}$$

Last row Coefficient from last to first with
opposite sign

⇒ The above State model is Controllable Canonical form. C CCF

⇒ The state models are not unique,
these are four types of state model.

- ① Controllable Canonical form.
- ② Observable Canonical form.
- ③ Diagonalization (or) Normal form.
- ④ Jordan Canonical form.

* Observable Canonical form:-

$$\Rightarrow A_{OCF} = (Acc_F)^T = \begin{bmatrix} 0 & 0 & -7 \\ 1 & 0 & -5 \\ 0 & 1 & -3 \end{bmatrix}$$

$$\Rightarrow B_{CCF} = \begin{bmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix}_{\text{start}}^{\text{end}} \Rightarrow B_{OCF} = \begin{bmatrix} b_3 \\ b_2 \\ b_1 \\ b_0 \end{bmatrix}_{\text{end}}^{\text{start}}$$

$$\Rightarrow C_{CCF} \Rightarrow B_{OCF} = \begin{bmatrix} 10 \\ 0 \\ 0 \end{bmatrix}.$$

$$\Rightarrow C_{CCF} = [c_0 \ c_1 \ c_2 \ c_3], \quad \text{start} \xrightarrow{\longrightarrow} \text{End}$$

$$C_{OCF} = [c_3 \ c_2 \ c_1 \ c_0] \quad \text{end} \xleftarrow{\longrightarrow} \text{start}.$$

$$C_{OCF} = [0 \ 0 \ 1].$$

$\ddot{y} + 2\ddot{\dot{y}} + 4\ddot{\ddot{y}} + 6\ddot{\dot{y}} + 8y = 50.$

Soln:

$$\begin{aligned} \ddot{y} &= x_1 & x_4 + 2x_3 + 4x_2 + 6x_1 + 8x_0 &= 50. \\ \dot{x}_1 &= \ddot{y} = x_2 & + 8x_0 &= 50. \\ \dot{x}_2 &= \ddot{\dot{y}} = x_3 & \therefore \dot{x}_4 &= -8x_1 - 6x_2 - 4x_3 \\ \dot{x}_3 &= \ddot{\ddot{y}} = x_4 & - 2x_0 &+ 50. \\ \dot{x}_4 &= \ddot{\dot{y}} = * \end{aligned}$$

$$\therefore A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -8 & -6 & -4 & -2 \end{bmatrix}, \quad B = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 5 \end{bmatrix}, \quad C = [1 \ 0 \ 0 \ 0].$$

State model to the Transfer Function

Q Write the State model to the given TF.

$$\frac{Y(s)}{U(s)} = \frac{2s+3}{s^2 + 5s + 6}$$

So,

$$\frac{Y(s)}{U(s)} = \frac{\dot{x}_1 = x_2 \quad 2s+3 \quad x_1}{s^2 + 5s + 6} \quad \text{①}$$

$\downarrow \quad \downarrow$

$$\therefore \ddot{y} = \dot{x}_3 = s^3 \dot{x}_2 \quad \dot{x}_2 = \dot{x}_1 = x_2 \quad \text{②}$$

So, $s^n = \dot{x}_n$

$$\Rightarrow U = \dot{x}_2 + 5x_2 + 6x_1$$

$$\therefore \dot{x}_2 = -6x_1 - 5x_2 + U \quad \text{--- ②}$$

$$\Rightarrow Y = 2\dot{x}_1 + 3x_1$$

$$Y = 2x_2 + 3x_1$$

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \underbrace{\begin{bmatrix} 0 & 1 \\ -6 & -5 \end{bmatrix}}_{\longrightarrow} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \end{bmatrix} [U].$$

$$[Y] = \begin{bmatrix} 2 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

Short-cuts:

$$\frac{Y(s)}{\rightarrow KU(s)} = \frac{K(2s+3)}{s^2 + ss + 6}$$

with same sign of
co-effs. C matrix
A matrix
with opposite sign of co-effs.

(Q) $\frac{Y(s)}{U(s)} = \frac{2s^3 + 4s^2 + 6}{s^5 + 3s^4 + 5s^3 + 7s^2 + 9s + 10}$

Soln:

$$\frac{Y(s)}{2U(s)} = \frac{-2(s^3 + 2s^2 + 3)}{s^5 + 3s^4 + 5s^3 + 7s^2 + 9s + 10}$$

$\downarrow \downarrow \downarrow \downarrow \downarrow \downarrow$
 $x_5 \quad x_4 \quad x_3 \quad x_2 \quad x_1 \quad x_0$

A =

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ -10 & -9 & -7 & -5 & -3 \end{bmatrix}, \quad B = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 2 \end{bmatrix}$$

$$C = \begin{bmatrix} 3 & 0 & 2 & 1 & 0 \end{bmatrix}.$$

* Diagonalization form:-

$$\Rightarrow \frac{Y(s)}{U(s)} = \frac{1}{(s+1)(s+2)(s+3)}$$

$$= \frac{Y_1}{s+1} - \frac{1}{(s+2)} + \frac{Y_2}{(s+3)}$$

$$\therefore y = \frac{\frac{1}{2}u}{(s+1)} + \frac{-1u}{(s+2)} + \frac{y_2 u}{(s+3)}$$

$$y = x_1 + x_2 + x_3.$$

$$\text{let, } x_1 = \frac{y_2 u}{(s+1)}, \quad x_2 = \frac{-1u}{(s+2)}, \quad x_3 = \frac{\frac{1}{2}u}{(s+3)}$$

$$\Rightarrow 5x_1 + x_1 = \frac{1}{2}u$$

$$\therefore \dot{x}_1 + x_1 = \frac{1}{2}u$$

$$\boxed{\dot{x}_1 = -x_1 + \frac{1}{2}u} \quad - \quad ①$$

$$\Rightarrow 5x_2 + x_2 = -u.$$

$$\therefore \dot{x}_2 + x_2 = -u.$$

$$\Rightarrow \boxed{\dot{x}_2 = -x_2 - u.} \quad - \quad ②.$$

$$\Rightarrow 5x_3 + 3x_3 = \frac{1}{2}u.$$

$$\therefore \dot{x}_3 + 3x_3 = \frac{1}{2}u$$

$$\therefore \boxed{\dot{x}_3 = -3x_3 + \frac{1}{2}u.} \quad - \quad ③.$$

$$\therefore \begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} \frac{1}{2} \\ -1 \\ y_2 \end{bmatrix} [u].$$

↑ Poles (6s)

* State Model to the Signal flow graph:

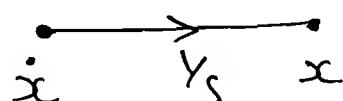

Write the state model to the following signal flow graph.

Soln:

\Rightarrow To select the node as a state variable, the incoming branch to that particular node must be a integrator,

like

$$\Rightarrow \dot{x}_3 = 1 \cdot U - 3\dot{x}_2 - 5x_1 - 7x_2.$$

$$\dot{x}_3 = U - 3x_3 - 5x_2 - 7x_1$$

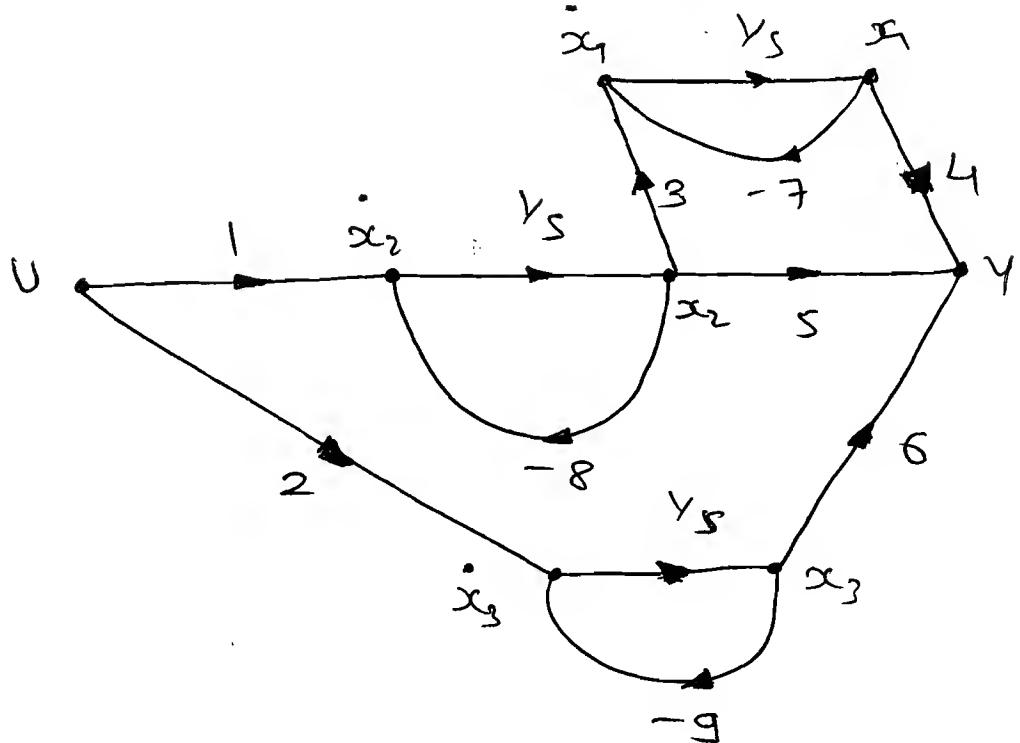

$$\therefore y = 2x_1 + 4x_2 + 6x_3$$

$$\therefore y = 2x_1 + 4x_2 + 6x_3.$$

$$\therefore \begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -7 & -5 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} [v].$$

$$[y] = [2 \ 4 \ 6] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}.$$

a)

$$\text{So: } \dot{x}_1 = -7x_1 + 3x_2.$$

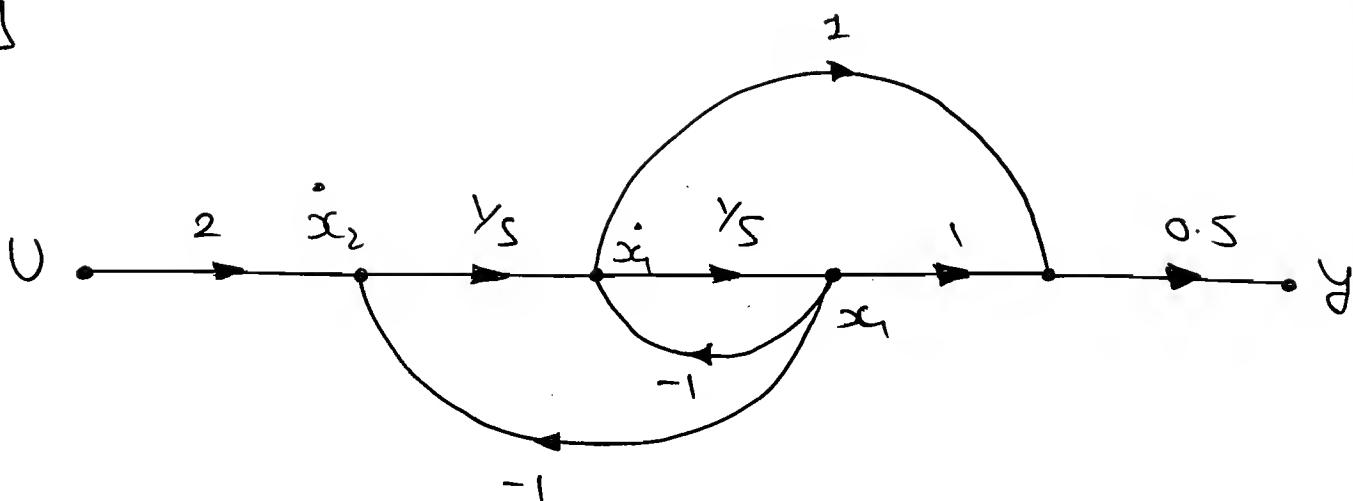

$$\dot{x}_2 = -8x_2 + 2 \cdot 0. \quad y = 4x_1 + 5x_2 + 6x_3$$

$$\dot{x}_3 = -9x_3 + 2 \cdot 0.$$

$$\therefore \begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} -7 & 3 & 0 \\ 0 & -8 & 0 \\ 0 & 0 & -9 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix} [v].$$

$$\therefore [y] = \begin{bmatrix} 4 & 5 & 6 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

(a)

Soln:

$$\dot{x}_1 = \dot{x}_2 - x_1 = x_2 - x_1$$

$$\dot{x}_2 = 2u - x_1.$$

$$\therefore y = (x_1 + x_3) 0.5$$

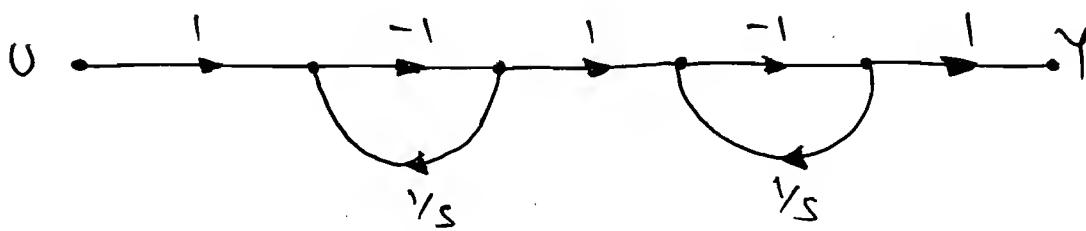

$$\therefore y = (x_2 - x_1 + x_1) 0.5$$

$$\therefore \boxed{y = 0.5 \dot{x}_2}$$

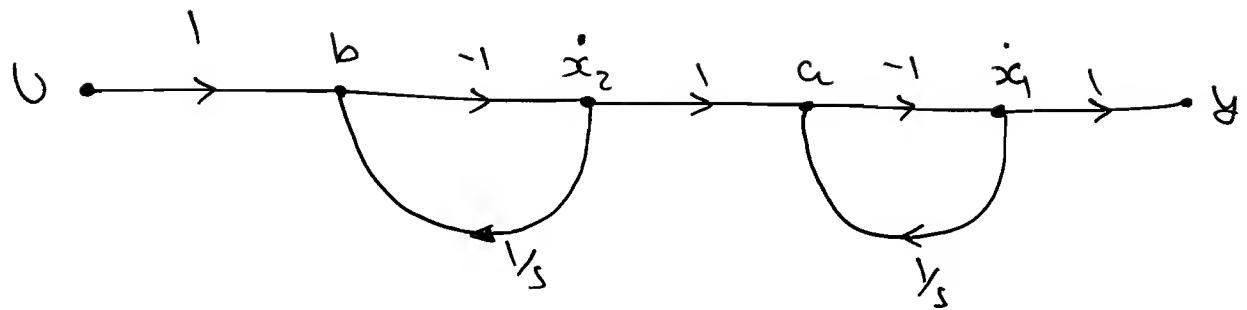

$$\therefore \begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 0 \\ 2 \end{bmatrix} [u].$$

$$\therefore [y] = \begin{bmatrix} 0 & 0.5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}.$$

(b)

S o n:

$$\Rightarrow a = \dot{x}_2 + \frac{1}{s} \cdot x_1$$

$$a = \dot{x}_2 + x_1$$

$$\Rightarrow \cancel{x_1} \neq b = j \cdot U + \dot{x}_2 / s.$$

$$\therefore b = U + s x_2$$

$$\dot{x}_2 = -b$$

$$\therefore \boxed{\dot{x}_2 = -U - x_2.}$$

$$\dot{x}_1 = -a.$$

$$\therefore \boxed{\dot{x}_1 = -x_1 - \dot{x}_2}$$

$$\boxed{\dot{x}_1 = -x_1 + s x_2 + U.}$$

$$\therefore y = \dot{x}_1$$

$$\therefore \boxed{y = -x_1 + x_2 + U.}$$

$$\Rightarrow \begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 1 \\ -1 \end{bmatrix} [U].$$

$$\therefore [y] = [-1 \quad 1] \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + [1] [U].$$

 State Model to the Electrical Netw:

\Rightarrow Select the state variables as
Voltage across Capacitors, and Current
through the ~~Conductors~~. Inductor.

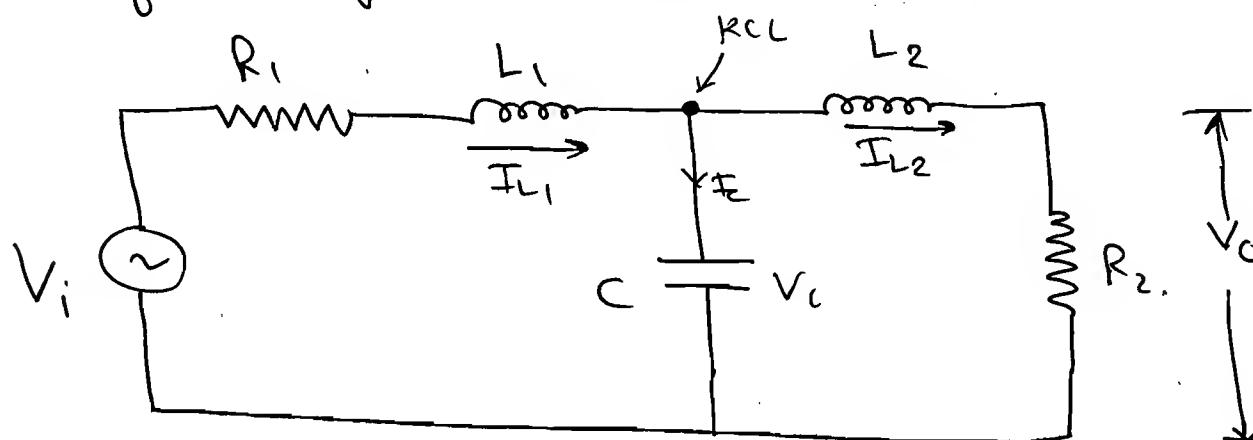

\Rightarrow The no. of state Variable $s =$ sum of Inductors & Capacitors.

\Rightarrow Write the independent KCL & KVL eqn.

\Rightarrow At Capacitor in apply KCL & apply KVL through the Inductor.

\Rightarrow The resultant eqn should consist, State Variables, differential State Variables, IIP Variables & o/p Variables.

Q Write the state model to the following system:

$$\text{Soln: } \text{SV (State Variable)} = \begin{bmatrix} V_C \\ I_{L1} \\ I_{L2} \end{bmatrix}$$

\Rightarrow KCL at Cap. jn

$$\therefore -I_{L1} + I_{L2} + C \frac{dV_C}{dt} = 0.$$

$$\therefore C \frac{dV_C}{dt} = I_{L1} - I_{L2}.$$

$$\dot{V}_c = \frac{I_{L_1}}{C} - \frac{I_{L_2}}{C} \quad \text{--- (1)}$$

$\rightarrow \underline{\underline{\text{KVL}_1}}$:

$$V_i - I_{L_1}R_1 - L_1 \frac{dI_{L_1}}{dt} - V_c = 0.$$

$$\therefore L_1 \frac{dI_{L_1}}{dt} = -I_{L_1}R_1 - V_c + V_i.$$

$$\therefore \dot{I}_{L_1} = -\frac{R_1}{L_1} \cdot I_{L_1} - \frac{V_c}{L_1} + \frac{V_i}{L_1}. \quad \text{--- (2)}$$

$\rightarrow \underline{\underline{\text{KVL}_2}}$:

$$V_c - L_2 \frac{dI_{L_2}}{dt} - I_{L_2}R_2 = 0.$$

$$\therefore L_2 \frac{dI_{L_2}}{dt} = -I_{L_2}R_2 + V_c.$$

$$\therefore \frac{dI_{L_2}}{dt} = -\frac{R_2}{L_2} \cdot I_{L_2} + \frac{V_c}{L_2}. \quad \text{--- (3)}$$

$$\Rightarrow \begin{bmatrix} \dot{V}_c \\ \dot{I}_{L_1} \\ \dot{I}_{L_2} \end{bmatrix} = \begin{bmatrix} 0 & \frac{1}{C} & -\frac{1}{C} \\ -\frac{1}{L_1} & \frac{-R_1}{L_1} & 0 \\ \frac{1}{L_2} & 0 & -\frac{R_2}{L_2} \end{bmatrix} \begin{bmatrix} V_c \\ I_{L_1} \\ I_{L_2} \end{bmatrix} + \begin{bmatrix} 0 \\ \frac{1}{L_1} \\ 0 \end{bmatrix} [V_i]$$

$$V_o = I_{L_2} \cdot R_2.$$

$$\therefore [V_o] = [0 \ 0 \ R_2] \begin{bmatrix} V_c \\ I_{L_1} \\ I_{L_2} \end{bmatrix}.$$

* Transfer function form the State

Model:

=>

$$T.F. = C [SI - A]^{-1} \cdot B + D.$$

$$T.F. = C \cdot \frac{\text{adj}[SI - A]}{|SI - A|} \cdot B + D.$$

=> The det of $SI - A$ i.e. $|SI - A| = 0$ gives the char. eqn.

=> The roots of the CE is called poles which are called eigen values.

(a) find the T.F. to the given state model.

$$\begin{bmatrix} \dot{x}_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} -2 & -3 \\ 4 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 3 \\ 5 \end{bmatrix} [U].$$

$$[Y] = [1 \ 1] \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}.$$

Soln: Add S diagonally & change the sign of coefficient to get $|SI - A|^{-1}$.

$$SI - A = \begin{bmatrix} S+2 & 3 \\ -4 & S-2 \end{bmatrix}.$$

$$\therefore (SI - A)^{-1} = \frac{\text{adj}(SI - A)}{|SI - A|} = \frac{\begin{bmatrix} S-2 & -3 \\ 4 & S+2 \end{bmatrix}}{S^2 - 4 + 12}.$$

$$\therefore T.F = C(CSI - A)^{-1} \cdot B + P.$$

$$= \frac{[1 \ 1]_{1 \times 2} \begin{bmatrix} s-2 & -3 \\ +4 & s+2 \end{bmatrix}_{2 \times 2} \begin{bmatrix} 3 \\ 5 \end{bmatrix}}{s^2 + 8}$$

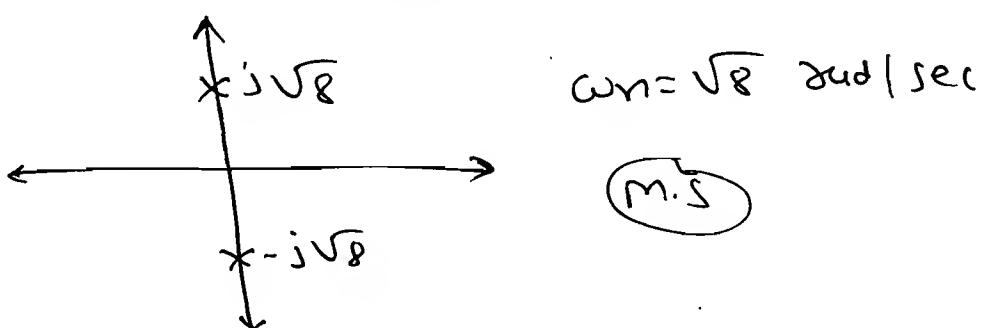

$$= \frac{[s+2 \ s-1] \begin{bmatrix} 3 \\ 5 \end{bmatrix}}{s^2 + 8}$$

$$= \frac{3s + 6 + 5s - 5}{s^2 + 8}$$

$$TF = \boxed{\frac{8s + 1}{s^2 + 8}}$$

$$\xrightarrow{CE} s^2 + 8 = 0 \Rightarrow s = \pm j\sqrt{8}$$

Marginaly stable (or) Undamped sys.

a) $\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} 0 & 3 \\ -2 & -5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \end{bmatrix} [0].$

$$[y] = [2 \ 1] \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}.$$

Sol'n:

$$SI - A = \begin{bmatrix} s & -3 \\ 2 & s+5 \end{bmatrix}.$$

$$(SI - A)^{-1} = \frac{\text{adj}(SI - A)}{|SI - A|}.$$

$$= \frac{\begin{bmatrix} s+5 & 3 \\ -2 & s \end{bmatrix}}{s^2 + 5s + 6}.$$

$$\therefore T.F. = C [SI - A]^{-1} B + D.$$

$$= \frac{\begin{bmatrix} 2 & 1 \end{bmatrix} \begin{bmatrix} s+5 & 3 \\ -2 & s \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{s^2 + 5s + 6}$$

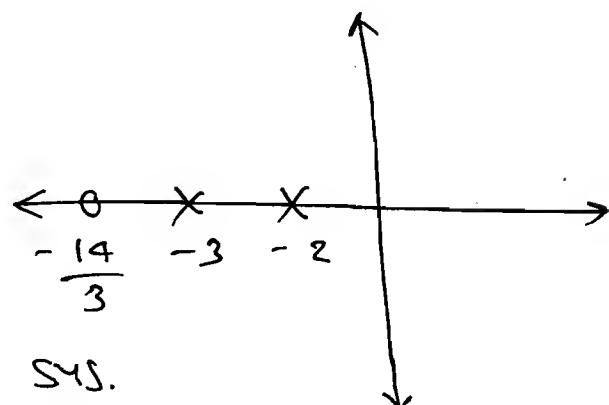

$$= \frac{\begin{bmatrix} 2s+8 & 6+s \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{s^2 + 5s + 6}$$

$$= \frac{2s+8 + 6+s}{s^2 + 5s + 6}.$$

$T.F. = \frac{3s + 14}{s^2 + 5s + 6}$

Stable /

over-damped

* Solution to the State eqn:-

$\Rightarrow \dot{x} = Ax + Bu \rightarrow$ Non-Homogeneous
State eqn.

M-I : Laplace Transform method.

$$\Rightarrow sx(s) - x(0) = Ax(s) + Bu(s).$$

$$\therefore sx(s) - Ax(s) = x(0) + Bu(s).$$

$$\therefore (sI - A)x(s) = x(0) + Bu(s).$$

$$\therefore x(s) = (sI - A)^{-1}x(0) + [sI - A]^{-1} \cdot Bu(s).$$

\Rightarrow Apply I.L.T.

$$\therefore x(t) = \mathcal{L}^{-1} \left\{ (sI - A)^{-1}x(0) \right\} + \mathcal{L}^{-1} \left\{ (sI - A)^{-1}Bu(s) \right\}$$

Zero State Response due to I.C. Zero Input Response due to I.P.

\Rightarrow The zero I.P. resp. (ZIR) is due to Initial Condition.

\Rightarrow The zero state resp. (ZSR) is due to I.P.

M-II : Classical Method.

$$x(t) = e^{At} x(0) + \int_0^t e^{A(t-\tau)} \cdot B \cdot u(\tau) d\tau.$$

(II)

\downarrow

ZIR

\downarrow

ZSR

\Rightarrow Compute ZIR terms,

$$\phi(t) = e^{At} = L^{-1} [S\mathbf{I} - A]^{-1}.$$

STM: State Transmission matrix.

$$\Rightarrow [S\mathbf{I} - A]^{-1} = L[\phi(t)] = \phi(s).$$

$$\therefore \boxed{\phi(s) = [S\mathbf{I} - A]^{-1}}$$

\Rightarrow Compute ZSR term:-

$$\int_0^t \phi(t-\tau) B u(\tau) d\tau = L^{-1} [\phi(s) \cdot B \cdot u(s)].$$

$$\Rightarrow \boxed{x(t) = e^{At} \cdot x(0) + L^{-1} [\phi(s) \cdot B \cdot u(s)]} \quad * *$$

* Properties of STM:-

$$\Rightarrow STM: \phi(t) = e^{At}.$$

$$\textcircled{1} \quad \phi(0) = e^0 = \mathbf{I} \quad (\text{Identity matrix}).$$

$$\textcircled{2} \quad \phi^k(t) = (e^{At})^k = A e^{A(kt)} = \phi(kt).$$

e.g. $\phi^{-1}(t) = \phi(-t).$

③ $\phi(t_1 + t_2) = \phi(t_1) \cdot \phi(t_2).$

④ $\phi(t_2 - t_1) \cdot \phi(t_1 - t_0) = \phi(t_2 - t_0).$

Q Obtain the Complete Sys. response
of the System given below:

$$\dot{x} = \begin{bmatrix} 0 & 1 \\ -2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}, \quad x(0) = \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \quad y = [1 \ -1] x.$$

Soln:

Homogenous State eqn:

$\dot{x} = Ax \rightarrow$ is called as homogenous
State eqn. ($U=0$).

$$\rightarrow x(t) = \phi(t) \cdot x(0) = Z \cdot I \cdot R. = e^{At} \cdot x(0).$$

$$x(t) = \phi(t) \cdot x(0)$$

$$\Rightarrow x(t) = L^{-1} [(S\mathbf{I} - A)^{-1} x(0)].$$

$$x(t) = L^{-1} [(S\mathbf{I} - A)^{-1} \cdot x(0)]$$

\Rightarrow The given state model is homogeneous
Hence the soln is

$$x(t) = Z \cdot I \cdot R. = e^{At} \cdot x(0) = \phi(t) \cdot x(0).$$

$$\Rightarrow \xrightarrow{\text{STA}} \phi(t) = e^{At} = L^{-1} [S\mathbf{I} - A]^{-1}.$$

$$\phi(t) = L^{-1} [(sI - A)^{-1}].$$

$$\Rightarrow (sI - A) = \begin{bmatrix} s & -1 \\ 2 & +s \end{bmatrix}$$

$$\Rightarrow (sI - A)^{-1} = \frac{\text{adj}(sI - A)}{|sI - A|}.$$

$$(sI - A)^{-1} = \frac{\begin{bmatrix} s & +1 \\ -2 & s \end{bmatrix}}{s^2 + 2}.$$

$$\therefore \phi(t) = L^{-1} \begin{bmatrix} \frac{s}{s^2 + 2} & \frac{1}{s^2 + 2} \\ \frac{-2}{s^2 + 2} & \frac{s}{s^2 + 2} \end{bmatrix}.$$

$$\therefore \phi(t) = \begin{bmatrix} \cos\sqrt{2}t & \frac{1}{\sqrt{2}} \sin\sqrt{2}t \\ -\sqrt{2} \sin\sqrt{2}t & \cos\sqrt{2}t \end{bmatrix}.$$

$$\rightarrow x(t) = ZIR = \phi(t) \cdot X(0).$$

$$= \begin{bmatrix} \cos\sqrt{2}t & \frac{1}{\sqrt{2}} \sin\sqrt{2}t \\ -\sqrt{2} \sin\sqrt{2}t & \cos\sqrt{2}t \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix}_{2 \times 1}$$

$$x(t) = \begin{bmatrix} \cos\sqrt{2}t + \frac{1}{\sqrt{2}} \sin\sqrt{2}t \\ \sqrt{2} \sin\sqrt{2}t + \cos\sqrt{2}t \end{bmatrix} \begin{bmatrix} -\sqrt{2} \sin\sqrt{2}t \\ + \cos\sqrt{2}t \end{bmatrix}$$

\Rightarrow The Complete Time Response is called $y(t)$.

→ Substitute x in y .

$$\therefore y(t) = \begin{bmatrix} 1 & -1 \end{bmatrix} \begin{bmatrix} \cos\sqrt{2}t + \frac{1}{\sqrt{2}}\sin\sqrt{2}t \\ -\sqrt{2}\sin\sqrt{2}t + \cos\sqrt{2}t \end{bmatrix}.$$

$$\therefore \cancel{y(t) = \cos\sqrt{2}t + \frac{1}{\sqrt{2}}\sin\sqrt{2}t + \sqrt{2}\sin\sqrt{2}t - \cos\sqrt{2}t.}$$

$$\therefore y(t) = \frac{3}{\sqrt{2}}\sin\sqrt{2}t.$$

(e) obtain the time response for unit - step IIP for a sys. given by.

$$\dot{x} = \begin{bmatrix} 0 & 1 \\ -2 & -3 \end{bmatrix}x + \begin{bmatrix} 0 \\ 5 \end{bmatrix}[0]$$

$$x[0] = \begin{bmatrix} 1 \\ 0 \end{bmatrix}, y = [0 \ 1]x.$$

Soln:

$$x(t) = \phi(t)x(0) + L^{-1} \left[\phi(s) \cdot B U(s) \right].$$

$$\Rightarrow \phi(t) = L^{-1} \left[(sI - A)^{-1} \right].$$

⇒ The given state model is non-homogeneous. Hence, soln is

$$x(t) = Z \cdot I \cdot R + Z \cdot S \cdot R.$$

$$\Rightarrow \overset{Z \cdot I \cdot R}{\overrightarrow{e^{At}}} \cdot x(0) \Rightarrow \phi(t) \cdot x(0).$$

$$\Rightarrow \phi(t) = L^{-1} \left[(sI - A)^{-1} \right].$$

$$\therefore sI - A = \begin{bmatrix} s & -1 \\ -2 & s+3 \end{bmatrix}.$$

$$(sI - A)^{-1} = \frac{\text{adj}(sI - A)}{|sI - A|}.$$

$$= \frac{\begin{bmatrix} s+3 & +1 \\ -2 & s \end{bmatrix}}{s^2 + 3s + 2}.$$

$$= \frac{\begin{bmatrix} s+3 & +1 \\ -2 & s \end{bmatrix}}{(s+2)(s+1)}.$$

$$\therefore \phi(t) = L^{-1} \left[\begin{array}{c} \frac{(s+3)}{(s+2)(s+1)} \\ \frac{-2}{(s+2)(s+1)} \end{array} \right] \begin{array}{l} \xrightarrow{\frac{1}{(s+2)(s+1)}} \\ \xrightarrow{\frac{s}{(s+2)(s+1)}} \end{array}$$

~~After~~

$$\phi(t) =$$

$$L^{-1} \begin{bmatrix} \frac{2}{s+1} - \frac{1}{s+2} & \frac{1}{s+1} - \frac{1}{s+2} \\ \frac{-2}{(s+1)} + \frac{2}{s+2} & -\frac{1}{s+1} + \frac{2}{s+2} \end{bmatrix}$$

=

$$\phi(t) =$$

$$\begin{bmatrix} 2e^{-t} - e^{-2t} & e^{-t} - e^{-2t} \\ -2e^{-t} + 2e^{-2t} & -e^{-t} + 2e^{-2t} \end{bmatrix}$$

$$\Rightarrow Z\text{-I.R.} = \phi(t) \cdot x(0).$$

$$= \begin{bmatrix} 2e^{-t} - e^{-2t} & e^{-t} - e^{-2t} \\ -2e^{-t} + 2e^{-2t} & -e^{-t} + 2e^{-2t} \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix}.$$

$$\therefore Z\text{-I.R.} = \phi(t) \cdot x(0).$$

$$= \begin{bmatrix} 2e^{-t} - e^{-2t} \\ -2e^{-t} + 2e^{-2t} \end{bmatrix}.$$

$$\Rightarrow Z_{SR} = L^{-1} [\phi(s) \cdot B(s)].$$

$$= L^{-1} \begin{bmatrix} \frac{s+3}{(s+1)(s+2)} & \frac{1}{(s+1)(s+2)} \\ \frac{-2}{(s+1)(s+2)} & \frac{s}{(s+1)(s+2)} \end{bmatrix} \begin{bmatrix} 0 \\ 5 \end{bmatrix} \begin{bmatrix} 1 \\ s \end{bmatrix}$$

$$= L^{-1} \begin{bmatrix} \frac{s+3}{(s+1)(s+2)} & \frac{1}{(s+1)(s+2)} \\ \frac{-2}{(s+1)(s+2)} & \frac{s}{(s+1)(s+2)} \end{bmatrix} \begin{bmatrix} 0 \\ 5/s \end{bmatrix}$$

$$= L^{-1} \begin{bmatrix} \frac{5}{s(s+1)(s+2)} \\ \frac{5}{(s+1)(s+2)} \end{bmatrix}$$

$$= L^{-1} \left[\frac{5}{2s} - \frac{5}{s+1} + \frac{5}{2(s+2)} \right]$$

$$= L^{-1} \left[\frac{5}{(s+1)} - \frac{5}{s+2} \right]$$

$$= \left[\frac{5}{2} - 5e^{-t} + \frac{5}{2} \cdot e^{-2t} \right]$$

$$\quad \quad \quad 5e^{-t} - 5e^{-2t}$$

$\underbrace{\qquad\qquad\qquad}_{ZSR}$

$$\rightarrow x(t) = ZFR + ZSR.$$

$$\Rightarrow x(t) = \left[\frac{5}{2} - 3e^{-t} + \frac{3}{2} e^{-2t} \right]$$

$$\quad \quad \quad 3e^{-t} + -3e^{-2t} \right].$$

$$\Rightarrow y = [0 \ 1] x(t).$$

$$y[t] = \begin{bmatrix} 0 & 1 \end{bmatrix} \begin{bmatrix} \frac{5}{2} - 3e^{-t} + \frac{3}{2} \cdot e^{-2t} \\ 3e^{-t} - 3e^{-2t} \end{bmatrix}$$

$$\therefore y(t) = 3e^{-t} - 3e^{-2t}$$

* Controllability & Observability :-

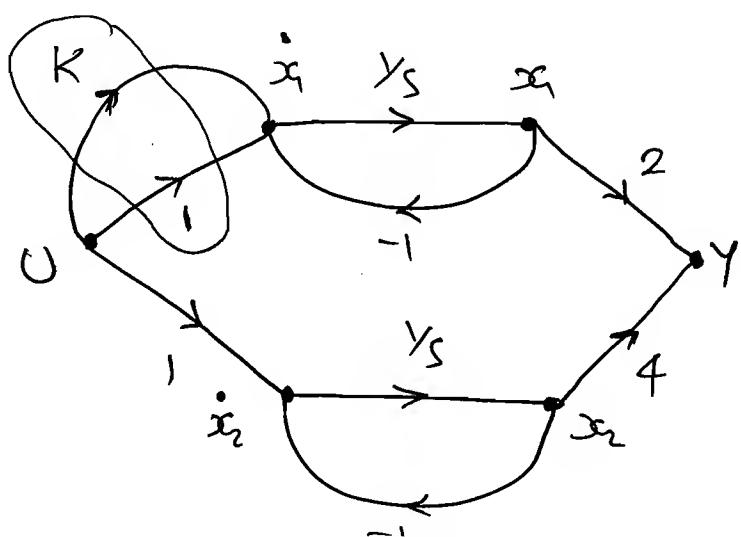

① Controllability :-

⇒ A sys. is ~~passive~~ Said to be Controllable if it is possible to transform the initial states to the desired state in a finite time interval by the controlled I/P.

⇒ If the SFG is given to check the Controllability observe the continuous path from I/P to each & every state variable.

⇒ If the path is exist then it is called Controllable.

Q Find the K value to become the system uncontrollable.

Soln: To become the system uncontrollable no path exist betⁿ the u to x

$$\rightarrow K+1 = 0 \Rightarrow \boxed{K=-1}$$

* Kalman's test for Controllability (Ω_c):-

$$\Rightarrow \Omega_c = [B \ AB \ A^2B \ \dots \ A^{n-1}B].$$

Controllable

$$\begin{array}{|c|} \hline \text{Rank of } \Omega_c = \text{Rank of } A \\ | \Omega_c | \neq 0. \\ \hline \end{array}$$

Check the Controllability to the given system.

$$\frac{Y(s)}{U(s)} = \frac{1}{s^3 + 2s^2 + 3s + 4}.$$

Soln:

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -4 & -3 & -2 \end{bmatrix}, B = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}.$$

$$\Rightarrow \Omega_c = \begin{bmatrix} B & AB & A^2B \\ 0 & 0 & 1 \\ 0 & 1 & -2 \\ 1 & -2 & +1 \end{bmatrix} \Rightarrow |\Omega_c| = 1 \neq 0$$

so, Controllable.

② Observability:

⇒ A sys. is said to be observable if it is possible to determine the initial states of the sys. by observing the op. in a finite time interval.

* Kalman's test for observability:-

$$\Rightarrow Q_0 = \begin{bmatrix} C^T & A^T C^T & (A^T)^2 \cdot C^T & \dots & (A^T)^{n-1} \cdot C^T \end{bmatrix}.$$

$$Q_0 = \begin{bmatrix} C \\ CA \\ CA^2 \\ \vdots \\ CA^{n-1} \end{bmatrix}$$

Observability

$\text{Rank of } Q_0 = \text{Rank of } A$ $ Q_0 \neq 0$

(a) Check the Controllability & observability for the following:-

System. $\dot{x} = \begin{bmatrix} 2 & 0 \\ -1 & 1 \end{bmatrix}x + \begin{bmatrix} 1 \\ -1 \end{bmatrix}u$.

$$Y = [1 \ 1] X$$

Soln:

$$\Omega_C = \begin{bmatrix} & \\ & \end{bmatrix} \Rightarrow \Omega_C = [B \ AB]$$

$$\Rightarrow \Omega_C = \begin{bmatrix} 1 & 2 \\ -1 & -2 \end{bmatrix}$$

$$|\Omega_C| = -2 + 2 = 0 \Rightarrow \text{Not Controllable.}$$

$$\Rightarrow \Omega_O = \begin{bmatrix} C \\ CA \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$$

$$\therefore |\Omega_O| = 1 - 1 = 0 \Rightarrow \text{Not observable.}$$

a) $\dot{x}_1 = -2x_1 + x_2 + u.$

$$\dot{x}_2 = -x_2 + u.$$

$$y = x_1 + x_2.$$

Soln:

$$A = \begin{bmatrix} -2 & 1 \\ 0 & -1 \end{bmatrix}, \quad B = \begin{bmatrix} 1 \\ 1 \end{bmatrix}.$$

$$C = [1 \ 1].$$

$$\rightarrow \Omega_C = \begin{bmatrix} B & AB \\ 1 & -1 \\ 1 & -1 \end{bmatrix} \Rightarrow |\Omega_C| = 0$$

$\Rightarrow \text{Not Controllable.}$

$$\Rightarrow Q_d = \begin{bmatrix} C \\ CA \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 1 \\ -2 & 0 \end{bmatrix}$$

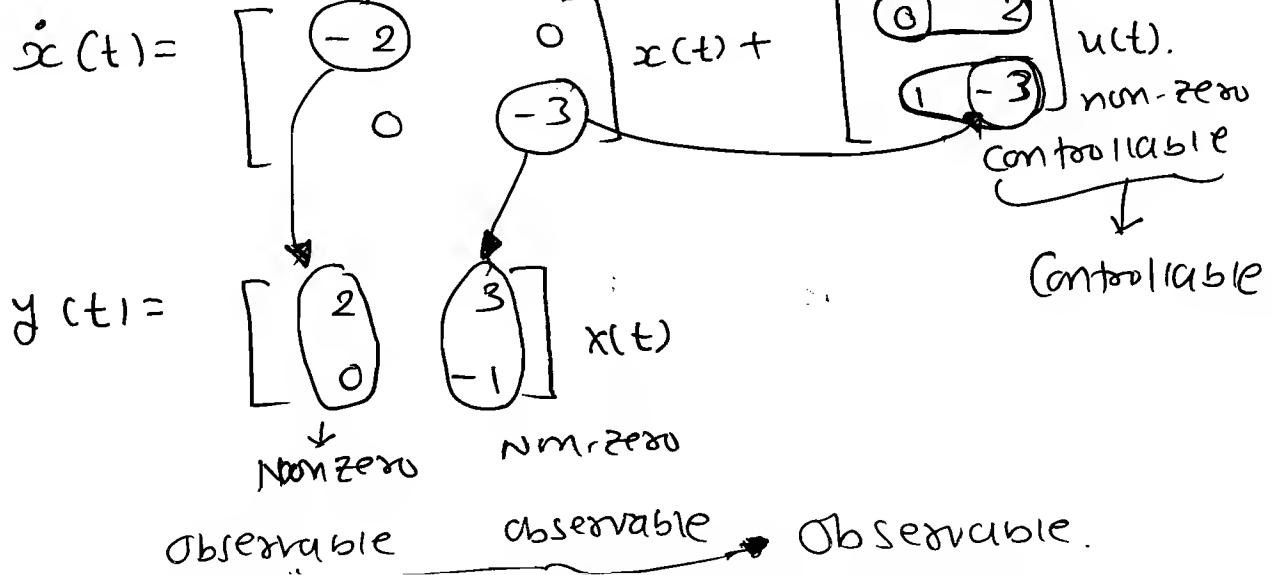

$\because |Q_d| = 2 \Rightarrow$ Observable.

\Rightarrow The Pole-Zero cancellation makes the system un-controllable & un-observable (or) Controllable & unobservable (or) uncontrollable & observable.

* Gibson test for Controllability & observability.

\Rightarrow The Gibson test is valid for only diagonalization form & Jordan Canonical form.

e.g.

\Rightarrow So, the given system is both observable and controllable.

e.g.

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} -2 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} 0 \\ 2 \\ 3 \end{bmatrix} u.$$

Jordan block.

$$[y] = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

Non-zero
Non-zero
 \therefore observable
non-zero
non-zero
 \therefore observable.
 $\underbrace{\qquad\qquad\qquad}_{\text{observable.}}$

Controlable
non-zero

\Rightarrow So, Sys. is controllable & observable.

Controllers & Compensators:-

* Purpose:-

- ⇒ If the System is unstable then Controllers and Compensators are required to make it stable & to achieve the required performance.
- ⇒ If the System is stable then also required a Compensator (or) controller to get the desired performance.
- ⇒ The Type-2 & Higher Order Sys. are usually un-stable. In this case it is essential to used lead compensator (or) PD Controller to make the sys. stable & to get the desired performance.
- ⇒ In Type-0 & Type-1 Sys., the stable operation is achieved by adjusting the sys. gain.
- ⇒ In this case we can use any Compensator (or) controller to get the required Specification.

Type-2: $C_r(s) \Big|_{\omega_c} = \frac{K}{s^2 + (s+2)(s+4)} ; H(s) = 1.$

$$\xrightarrow{\text{CE}} s^4 + 6s^3 + 8s^2 + K \xrightarrow{s \to \infty} 0 - \quad (1)$$

s^4 missing

With P-D Controller $= (K_p + K_d s)$.

$$C_r(s) \Big|_{\omega_c} = \frac{K(K_p + K_d s)}{s^2(s+2)(s+4)} ; H(s) = 1.$$

$$\xrightarrow{\text{CE}} s^4 + 6s^3 + 8s^2 + K K_d s + K K_p = 0 \longrightarrow (2).$$

Type-1:

$$C_r(s) \Big|_{\omega_c} = \frac{K}{s(s+2)(s+4)} ; H(s) = 1.$$

$$\xrightarrow{\text{CE}} s^3 + 6s^2 + 8s + K \xrightarrow[s=0]{s \to 48} 0 \longrightarrow (3)$$

48

* Compensators:

\Rightarrow A Compensator is a electrical N/W which adds finite poles & finite zeros to the System, so that the sys. performance is changed as per the requirement.

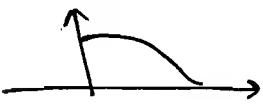

\Rightarrow There are three types of Compensators.

① Lead Compensator

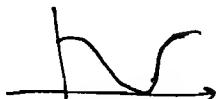

\rightarrow High pass filter.

② Lag Compensator

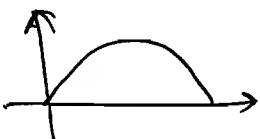

\rightarrow Low pass filter.

③ Lag-Lead Compensator

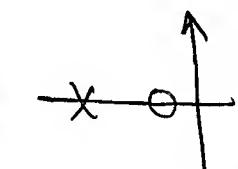

\rightarrow Band Stop filter.

④ Lead-Lag Compensator

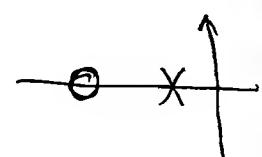

\rightarrow Band pass filter.

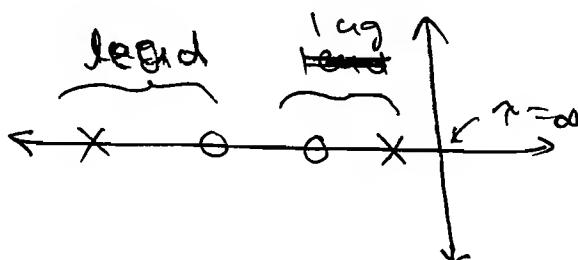

* HPF \rightarrow Lead Com. \rightarrow +ve angle \Rightarrow zeros

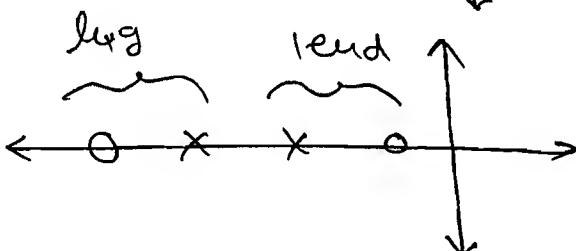

* LPF \rightarrow Lag Comp. \rightarrow -ve angle \Rightarrow Poles

* BSF \rightarrow $T_{lag} > T_{lead}$

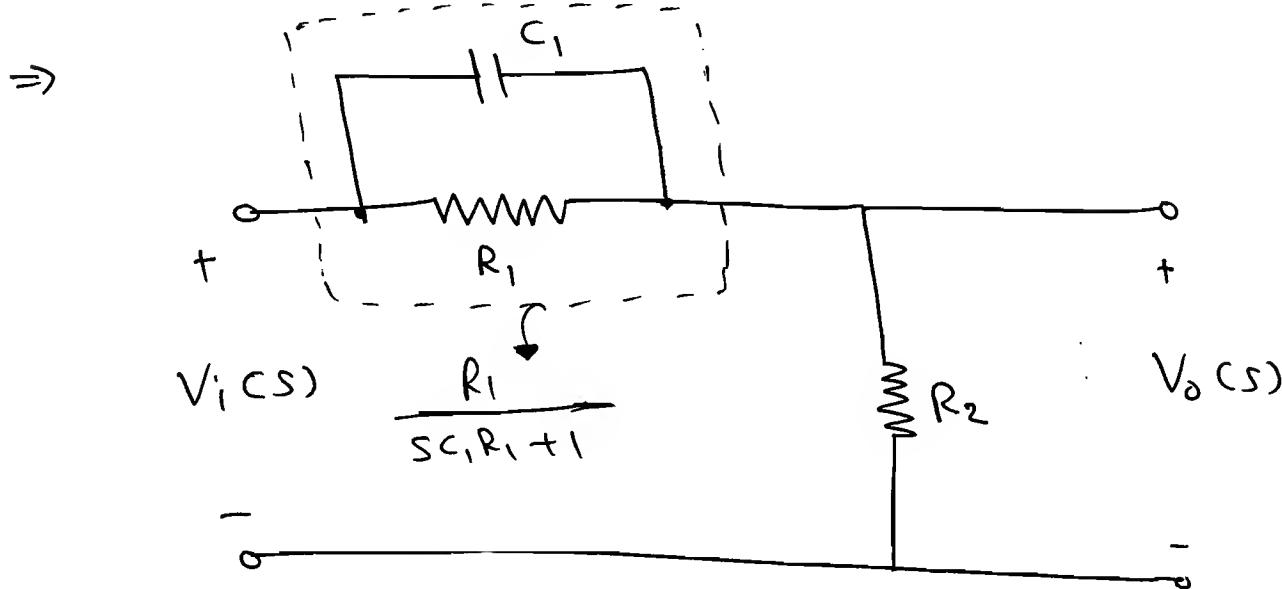

* BPF \rightarrow $T_{lead} > T_{lag}$

① Lead Compensators :-

\Rightarrow When sinusoidal IIP is applied to a circuit it produce a sinusoidal steady state o/p, having a phase lead with respect to IIP, then the circuit is called lead compensator.

⇒ The lead compensator improves the transient performance & also margin for the sus. stability.

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{R_2}{\frac{R_1}{sC_1R_1 + 1} + R_2}$$

$$\frac{V_o(s)}{V_i(s)} = \frac{R_2 (sC_1R_1 + 1)}{R_1 + R_2 (sC_1R_1 + 1)}$$

⇒ S₁: T.F.

S₂: T-const.

S₃: Poles & zeros → S-plane.

S₄: Bode plot.

S₅: Identity filters.

S₆: ω_m , ϕ_m , M/ω_m .

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{R_2 (1 + sC_1R_1)}{R_1 + R_2 + sC_1R_1R_2}$$

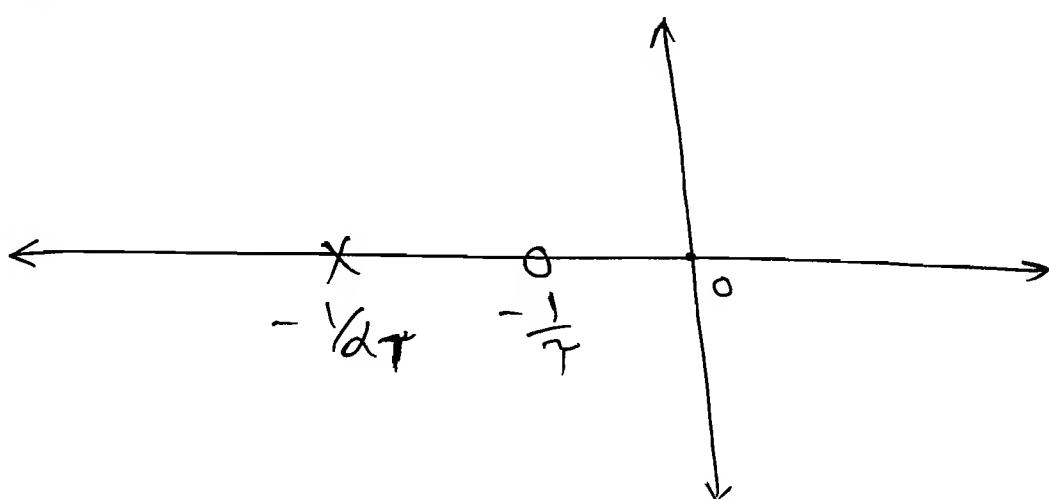

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{\frac{R_2}{R+R_2} (1 + sC_1 R_1)}{\left[1 + \frac{R_2}{R_1+R_2} sC_1 R_1 \right]}$$

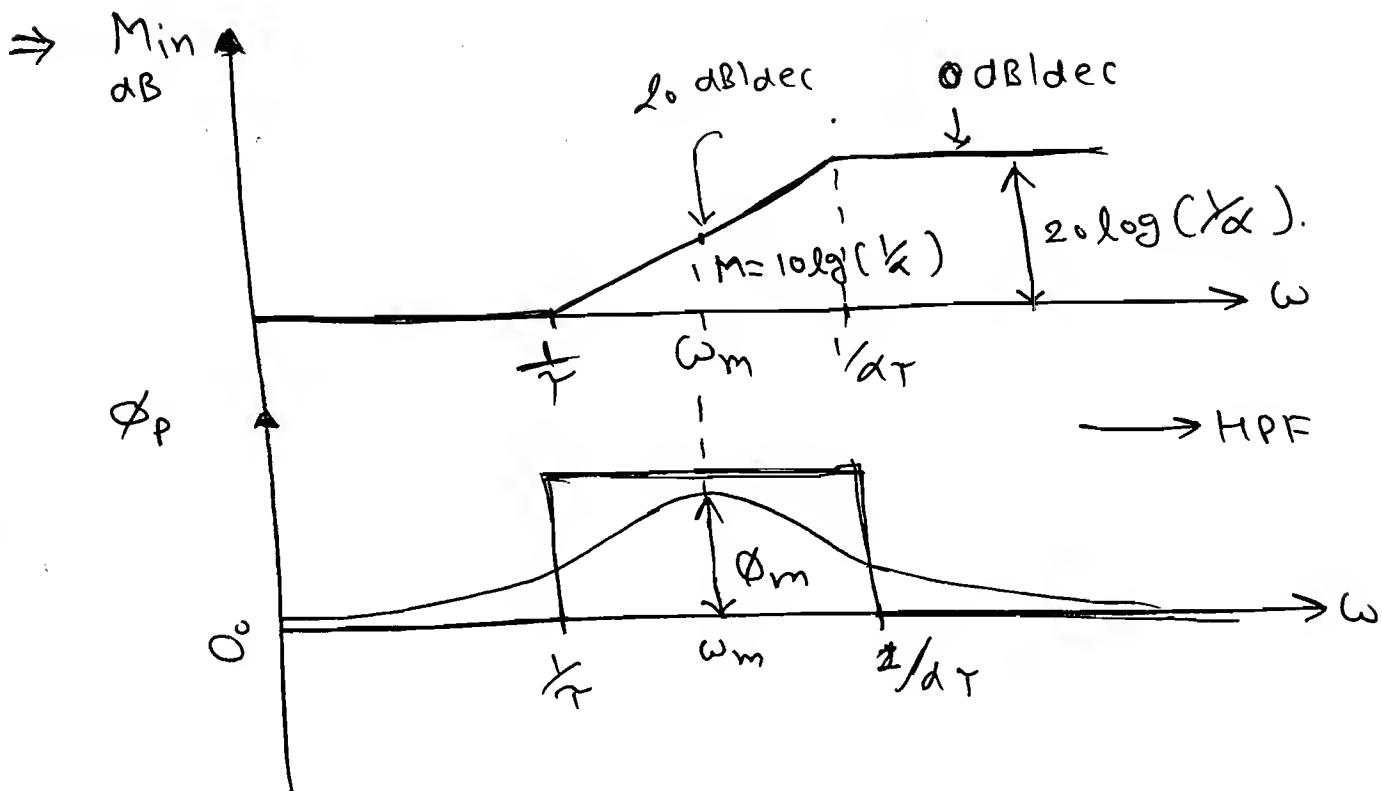

\Rightarrow let, α is called lead const. $= \frac{R_2}{R_1+R_2} < 1$
 $(\alpha \neq 0.07)$.

$$\tau \rightarrow \text{lead Time-const.} = R_1 C_1.$$

$$\Rightarrow \boxed{\frac{V_o(s)}{V_i(s)} = \frac{\alpha (1 + \tau s)}{(1 + \alpha \tau s)}} \quad \alpha_{\text{optimum}} = 0.1.$$

\Rightarrow The disadvantage of lead compensator is it creates the attenuation in the sys. To eliminate attenuation we require to add amp. with the gain of γ_α , which add the cost & space to the system.

$$\Rightarrow \omega_m = \sqrt{\omega_{c1} \times \omega_{c2}}, \quad \omega_m = \sqrt{\frac{1}{\tau} \times \frac{1}{\alpha\tau}}$$

$$\therefore \omega_m = \frac{1}{\tau\sqrt{\alpha}} \text{ dual sec.}$$

$$\therefore \boxed{\phi_{max} = \sin^{-1} \left(\frac{1-\alpha}{1+\alpha} \right)}. \quad * *$$

* Advantages:

- ⇒ A lead Compensator improves the transient performance.
- ⇒ The lead Compensator is a high Pass filter hence the B.W. of the sys. improves.
- ⇒ As B.W. increases, the rise-time decreases the sys. gives very quick response.
- ⇒ The lead Compensation improves the

damping of the system. ($\xi \omega_n$) - Hence, settling time (t_s) decreases (\downarrow).

\Rightarrow The lead Compensators improves the Gain Margin & Phase margin of the Sys. Hence, relative stability improves.

\Rightarrow The Lead Compensator is similar to P-D Controllers.

* Disadvantages:-

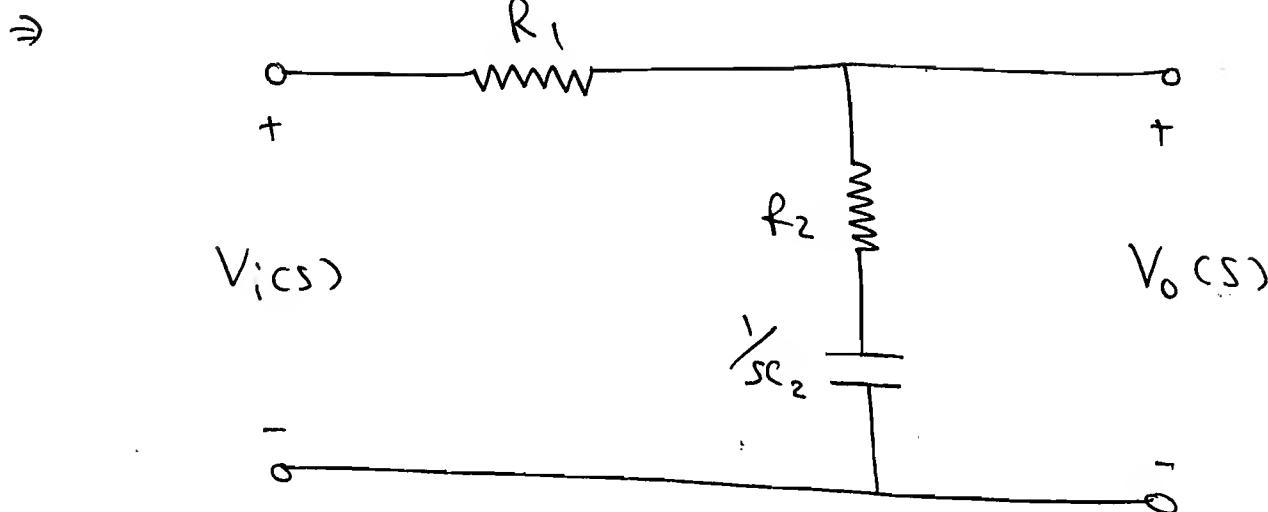

\Rightarrow The lead Compensator creates the attenuation in the sys. to eliminate the attenuation we required to add an amplifier with a gain of Y_X .

\Rightarrow The lead Comp. is a HPF - Hence noise power enters into the system so, the SNR at output is poorer.

\Rightarrow The max lead given by lead Comp is 60° , if required more than 60° we required to use multi stage Compensator.

②

Lag Compensator:-

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{R_2 + \frac{1}{jC_2}}{R_1 + R_2 + \frac{1}{jC_2}}$$

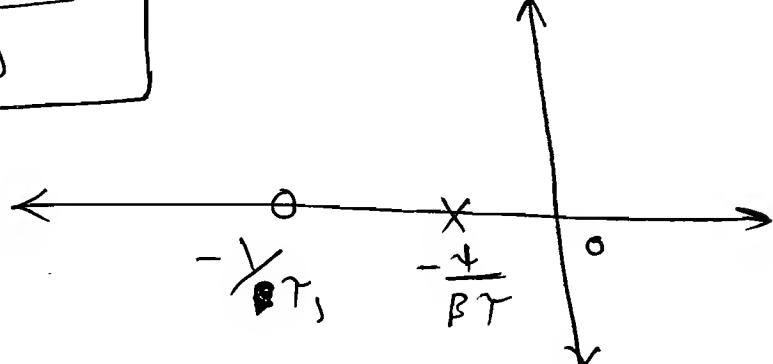

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{jC_2 R_2 + 1}{1 + jC_2 (R_1 + R_2)}$$

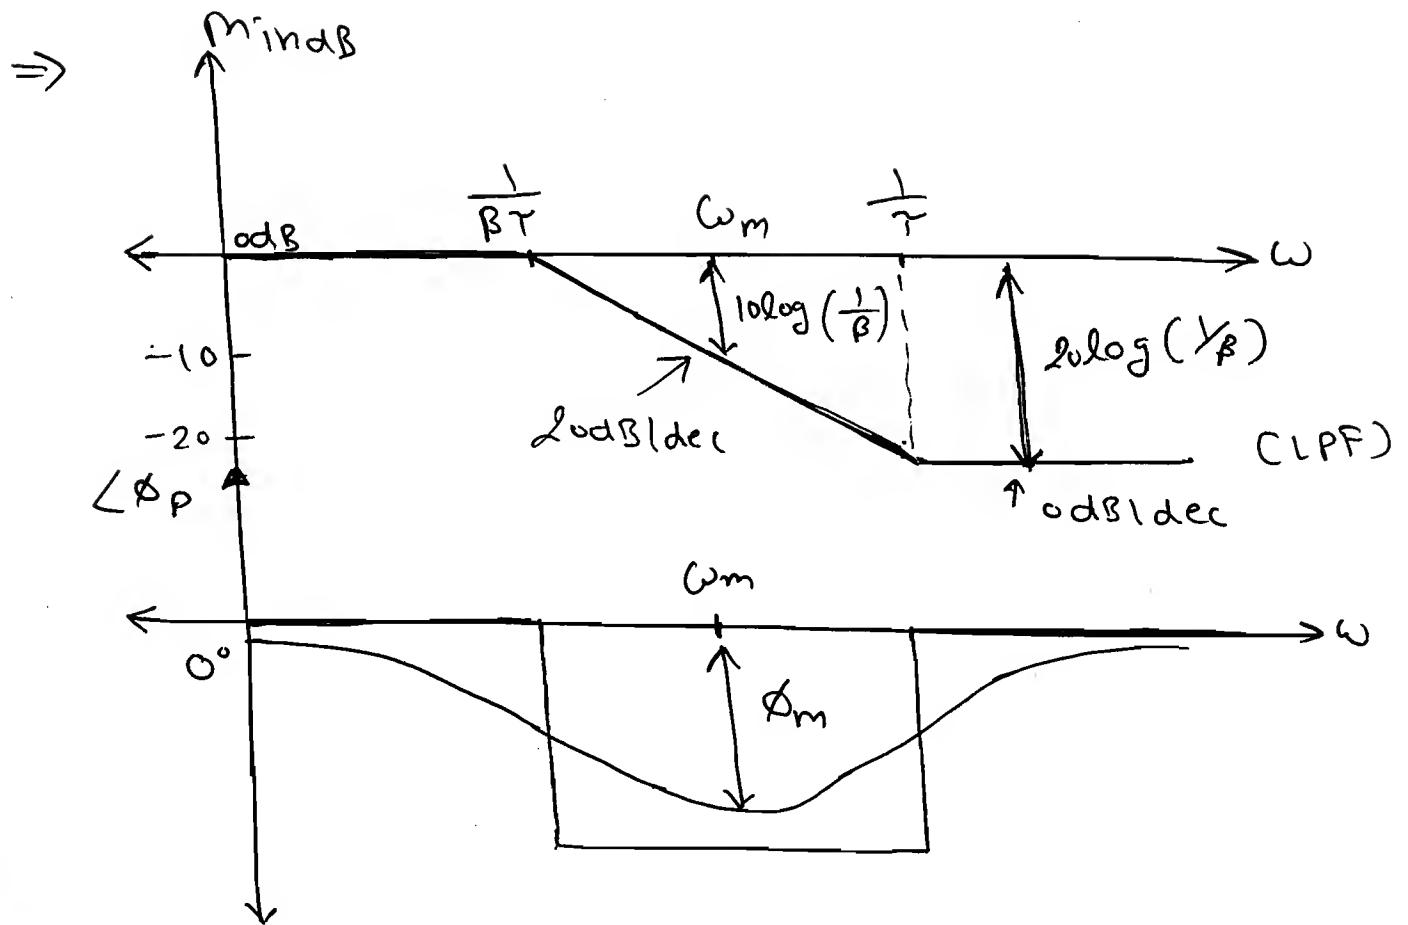

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{jC_2 R_2 + 1}{1 + jC_2 R_2 \left(\frac{R_1 + R_2}{R_2} \right)}$$

$$\beta \Rightarrow \text{lag constant} = \frac{R_1 + R_2}{R_2} > 1 \quad (\beta_{\text{opt}} = 10)$$

$$\gamma = \text{lag time const} = R_2 C_2$$

$$\therefore \boxed{\frac{V_o(s)}{V_i(s)} = \frac{1 + \gamma s}{1 + \beta \gamma s}}$$

$$\Rightarrow \omega_m = \sqrt{\omega_{c1} \times \omega_{c2}} = \sqrt{\frac{1}{\beta\tau} \times \frac{1}{\tau}}$$

$$\omega_m = \frac{1}{\sqrt{\beta \cdot \tau}} \text{ rad/sec.}$$

$$\therefore \phi_m = \sin^{-1} \left(\frac{\beta-1}{\beta+1} \right).$$
* * *

* Advantages:

\Rightarrow The lag Compensator is a LPF, it improves the steady state performance (steady state error \downarrow , accurate O/P).

\Rightarrow The lag Compensator is a LPF, it eliminate the noise in the system, hence SNR at the O/P is improved.

⇒ The main ~~compensator~~ purpose of lag Compensator is to provide the sufficient Phase Margin to the system.

* Disadvantages:-

⇒ The lag Compensator decreases the BW, hence the rise time increases hence the system gives the slow response.

⇒ The lag Compensator is similar to the PI Controller. With lag Comp. System becomes very sensitive with parameter variation.

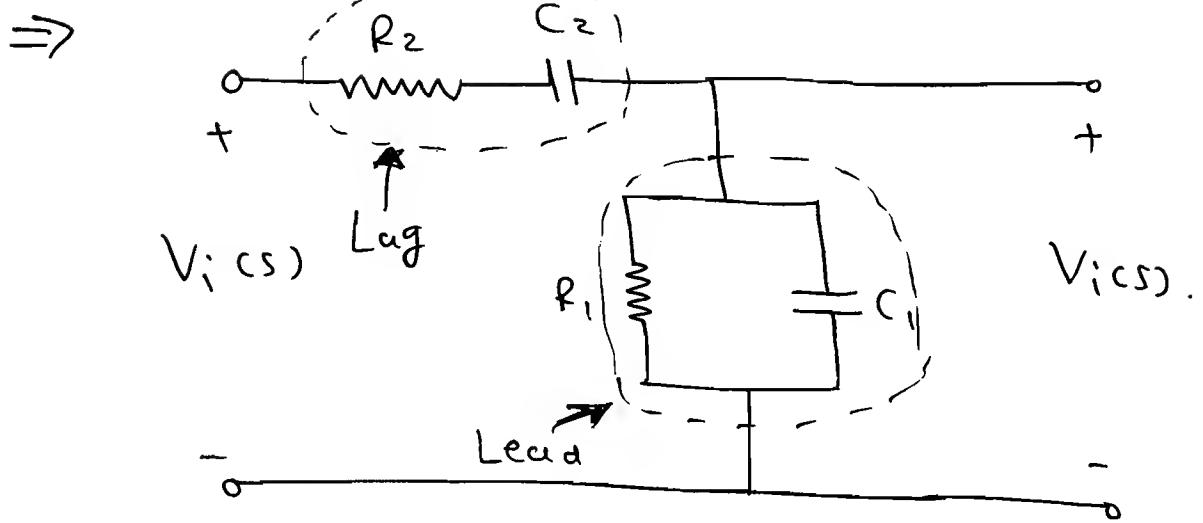

③ Lag - Lead Compensators:-

$$(T_{\text{lag}} > T_{\text{lead}}).$$

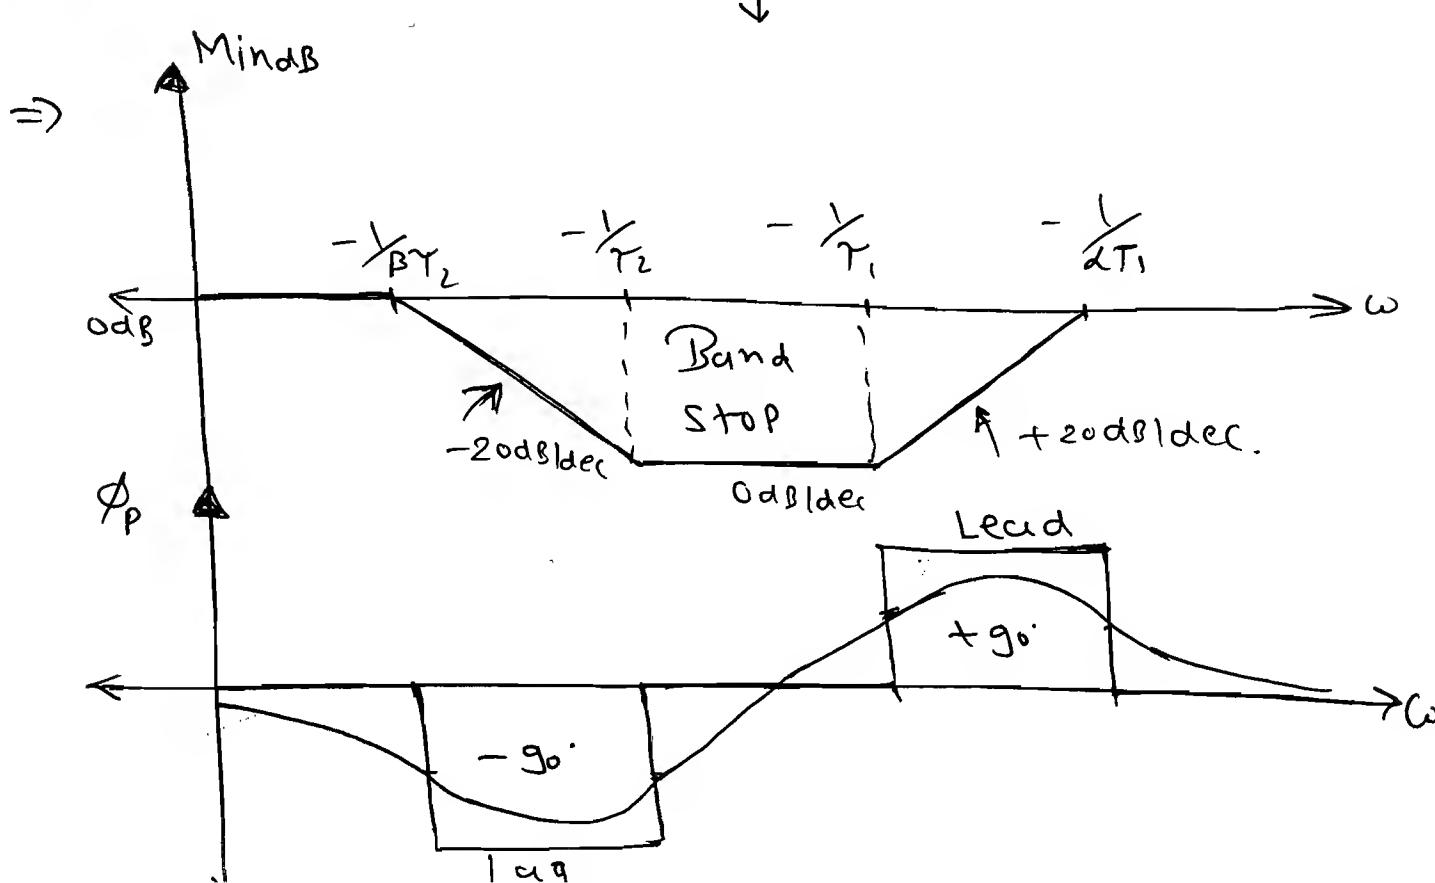

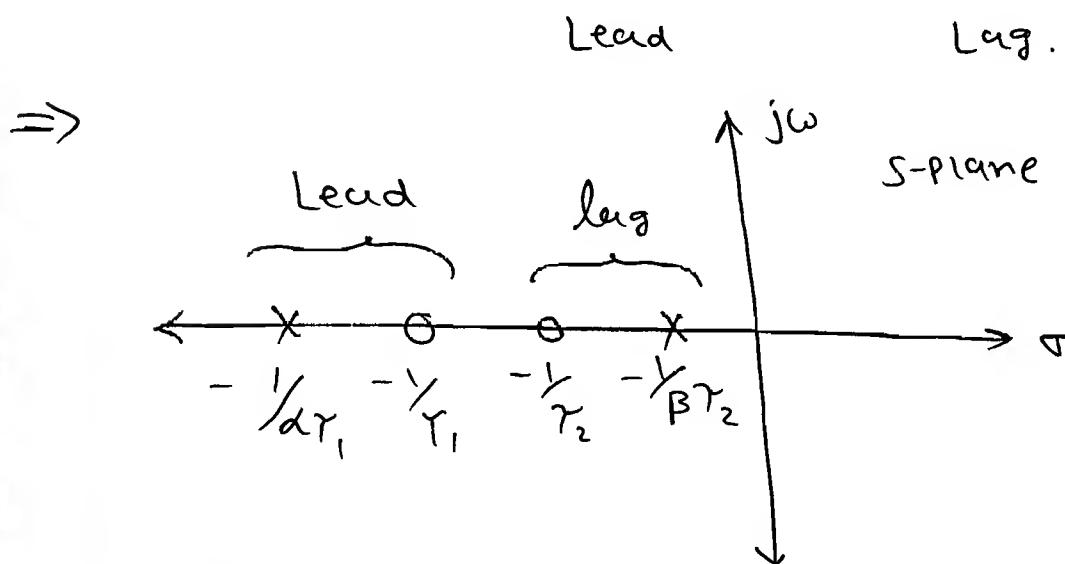

⇒ The Lag - Lead Compensator is used to get the very quick response and good static accuracy.

(Rise time \downarrow & $T_{\text{ss}} \downarrow$).

⇒ The ckt of lag - lead Compensator is shown in fig.

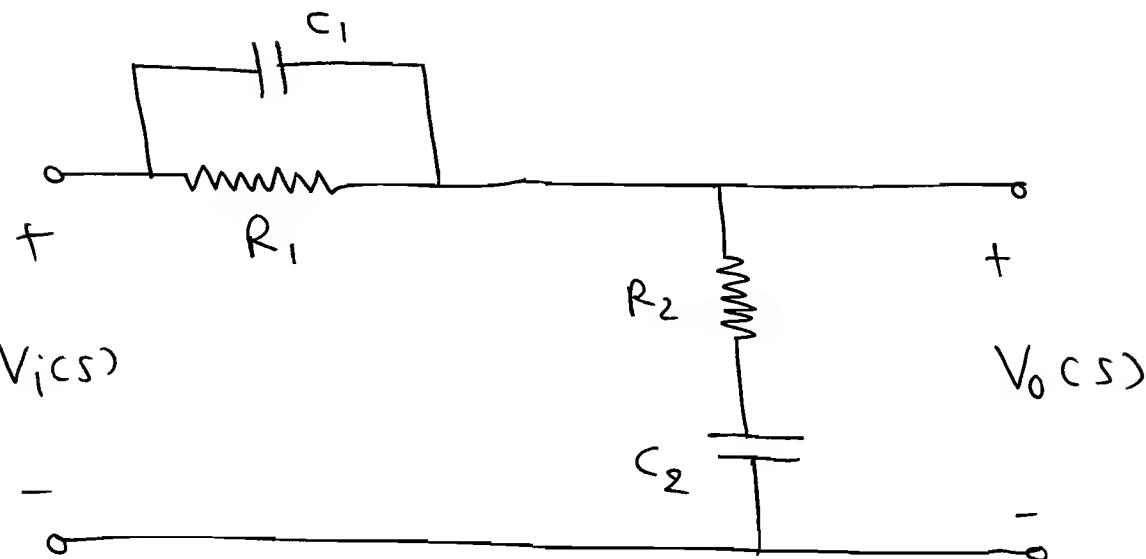

$$\frac{V_o(s)}{V_i(s)} = \left(\frac{1 + \gamma_1 s}{1 + \alpha \gamma_1 s} \right) \left(\frac{1 + \gamma_2 s}{1 + \beta \gamma_2 s} \right)$$

(4)

Lead-lag Compensators:

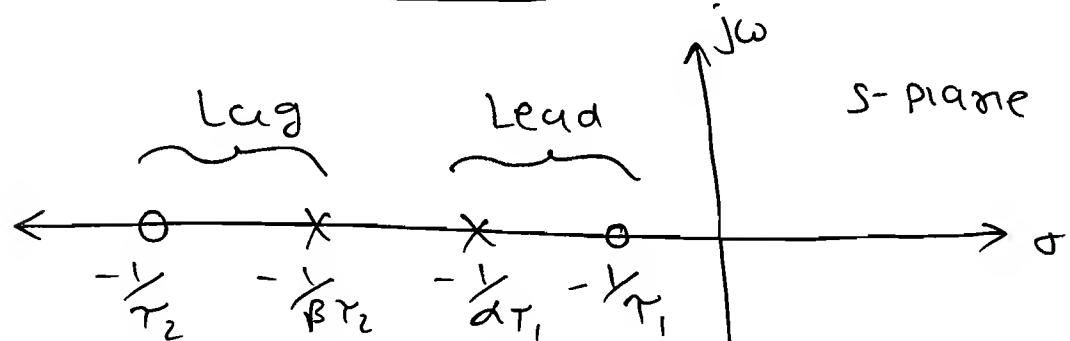

⇒

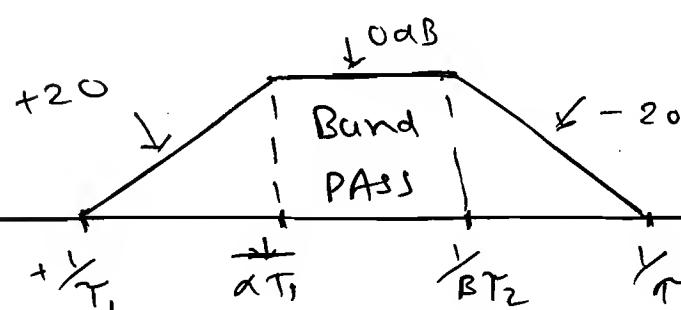

$$\text{T.F. } \frac{V_o(s)}{V_i(s)} = \left(\frac{1 + \gamma_1 s}{1 + \alpha \gamma_1 s} \right) \times \left(\frac{1 + \gamma_2 s}{1 + \beta \gamma_2 s} \right).$$

$$\gamma_{\text{lead}} > \gamma_{\text{lbg}}$$

⇒

⇒ Min dB

 $\angle \phi_p$ $+90^\circ$ -90° $1/\omega_2$

Lead

 -90° $1/\omega_2$ $+90^\circ$

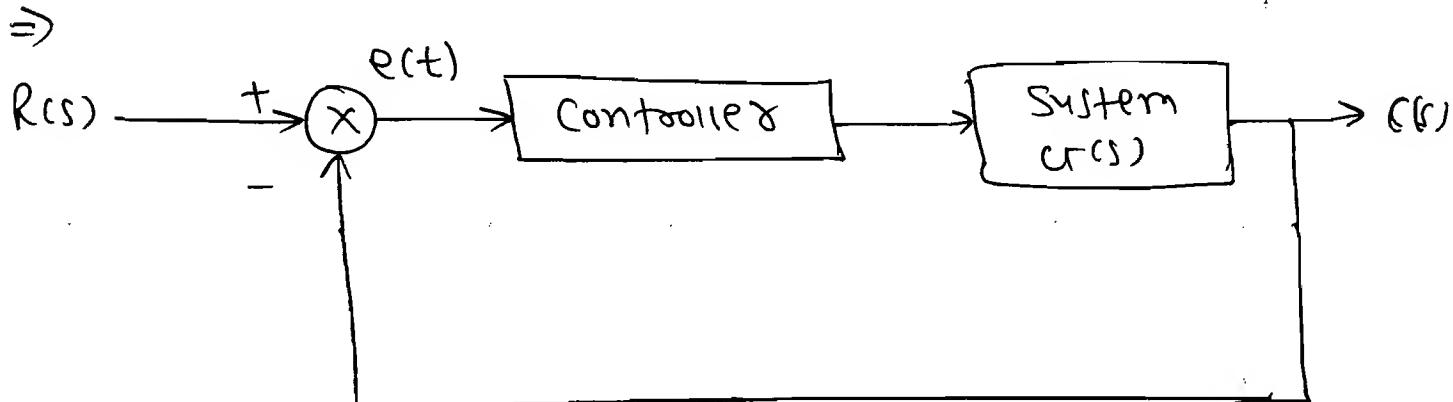

* Controllers :-

⇒ The Controller is a device which is used to control the transient and steady state response as per requirement.

⇒ The best system demand Smallest ζ , Smallest T_s , Smallest e_{ss} , Smallest M_p .

⇒ To get above requirements we require to add a controller to the system.

⇒ The block diagram with the controller is shown in fig.

- ⇒ ① P Controller ④ PD controller.
- ② D controller ⑤ PI controller.
- ③ I controller ⑥ PID controller.

① Proportional Controller :-

* Purpose :-

⇒ To change the transient response as per the requirement.

⇒ The T.F. of Proportional Controller is K_p

$$P_{\text{Controller}} = K_p.$$

for e.g.

$$\rightarrow G(s) \Big|_{\substack{\text{without} \\ \text{Controller}}} = \frac{1}{s(s+10)}.$$

$$\Rightarrow CLTF = \frac{1}{s^2 + 10s + 1} \Rightarrow \omega_n = 1 \text{ rad/sec}$$

$$2\zeta\omega_n = 10$$

$$\zeta = 5 > 1$$

⇒ overdamped system.

$$\Rightarrow G(s) \Big|_{\substack{\text{with} \\ \text{Controller}}} = \frac{K_p}{s(s+10)}$$

$$\rightarrow CLTF = \frac{K_p}{s^2 + 10s + K_p}.$$

$$\rightarrow \text{let, } K_p = 100 \Rightarrow \omega_n = 10 \text{ rad/sec.}$$

$$2\zeta\omega_n = 10$$

$$\boxed{\zeta = 0.5} \Rightarrow \text{under damped sys.}$$

$$\rightarrow \text{let, } K_p = 25, \omega_n = 5$$

$$\nexists \boxed{\zeta = 1} \Rightarrow \text{critical damped sys.}$$

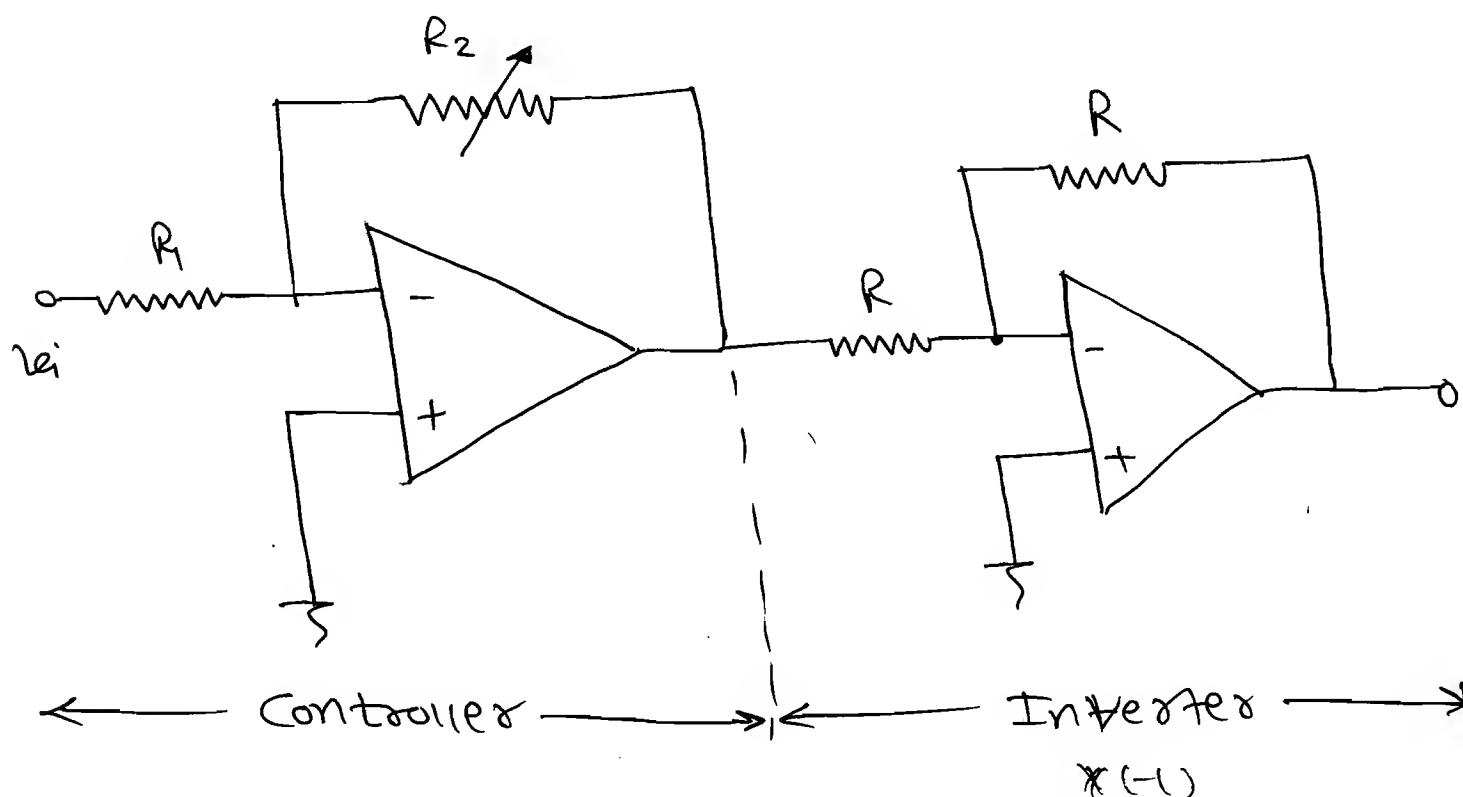

\Rightarrow If selecting the proper value of K_p we can get the required Transient response.

* * $K_p \uparrow \rightarrow \omega_n \uparrow \rightarrow \zeta \downarrow \rightarrow \% \cdot m_p \uparrow \rightarrow$ less R_s & more OSC.

\Rightarrow Proportional Controller can not eliminate error in the system.

\Rightarrow If the $K_p \uparrow$, to get the better transient response $\zeta \downarrow$. Hence the $\% \cdot m_p$ increases, the sys. become more oscillatory & less relative stable.

\Rightarrow Practical Proportional Controller:-

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{\cancel{R_2}}{R_1} = K_p.$$

(2) Integrated Controller (or) RESET Controller :-

* Purpose:-

- ⇒ To decrease the steady state error (ess).
- ⇒ The T.F. of Integral Controller is $\frac{K_I}{s}$.
- ⇒ The integrated controller added the one pole at origin Hence, Type is increases.
- ⇒ As the Type increases, the ess \downarrow but the System Stability is affected.

E.g.: $\rightarrow G(s) \Big|_{\text{without Controller}} = \frac{1}{s(s+10)}$, Type-1.

CE $\rightarrow s^2 + 10s + 1 = 0 \rightarrow$ Stable.

$\rightarrow G(s) \Big|_{\text{with Controller}} = \frac{K_I}{s^2(s+10)}$, Type-2, ↑ ess ↓
(more accurate)

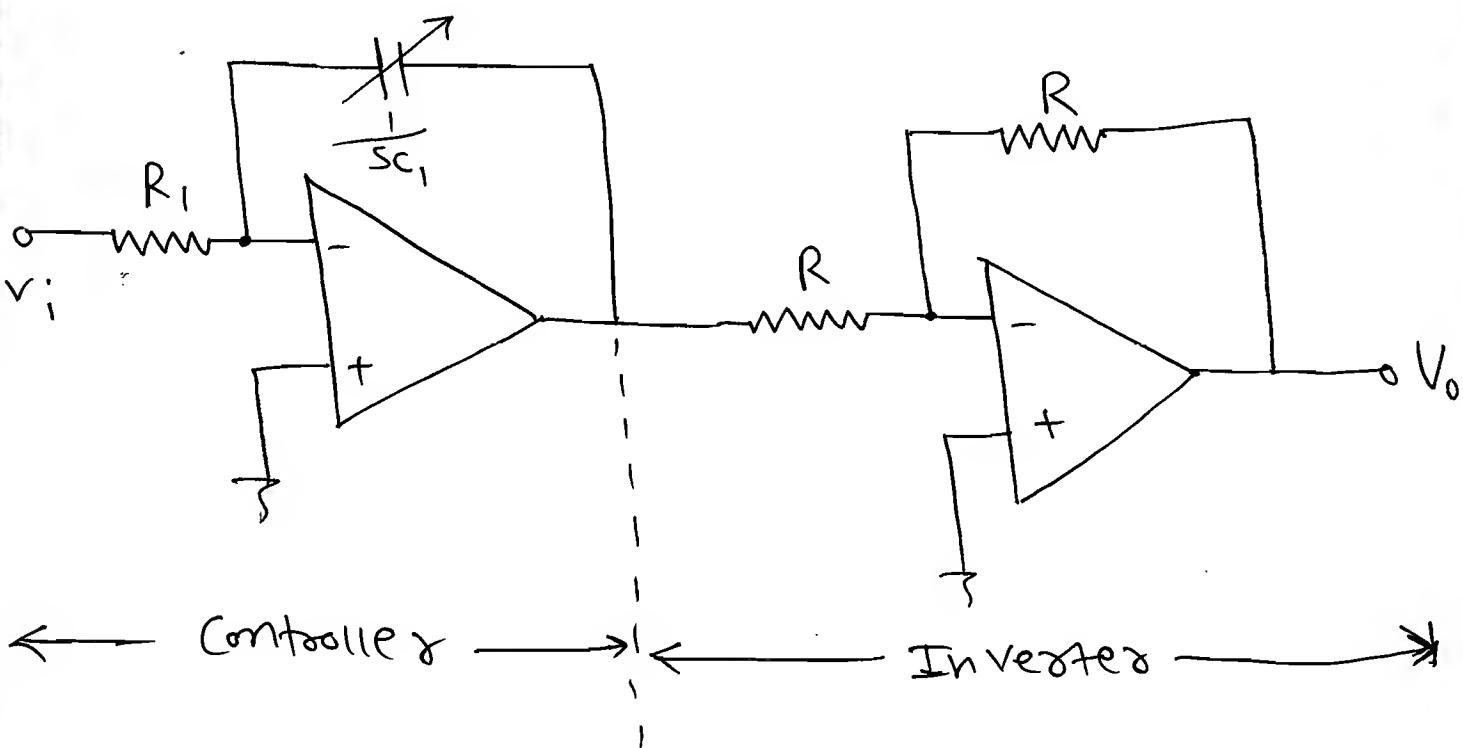

$$\xrightarrow{CE} s^3 + 10s^2 + K_I = 0 \rightarrow \text{Un-Stable.}$$

\Rightarrow The integral Controller effect the sys. Stability. Hence, before using the integral Controller we required to verify the sys. Stability.

\Rightarrow If the System Stability is affected the integral Controller are not used.

* Practical CKt of Integral Controller:-

\Rightarrow

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{Y_{SC}}{R} = \frac{1}{SCR} = \frac{1}{T_I s} = \frac{K_I}{s}.$$

Where, $K_I = \frac{1}{T_I} = \frac{1}{RC}$.

③ Derivative

Controller :- (RATE Controller)

* Purpose:-

⇒ To improve the Stability.

⇒ T.F. of Derivative controller is $K_D s$.

⇒ The Derivative controller adds 1 zero at origin.

$$T.F. \text{ of D controller} = K_D s.$$

⇒ The best example of derivative controller is Techo-meter.

→ With D controller added one zero at origin. Hence the type is ↓.

→ As type ↓, the sys. stability improved but sys. become less accurate. (ess ↑).

$$\text{Ex. } \rightarrow G(s) \Big|_{\text{without controller}} = \frac{1}{s^2(s+10)} \quad \text{Type-2.}$$

$$\underline{CE} \rightarrow s^3 + 10s^2 + 1 = 0 \rightarrow \text{Unstable.}$$

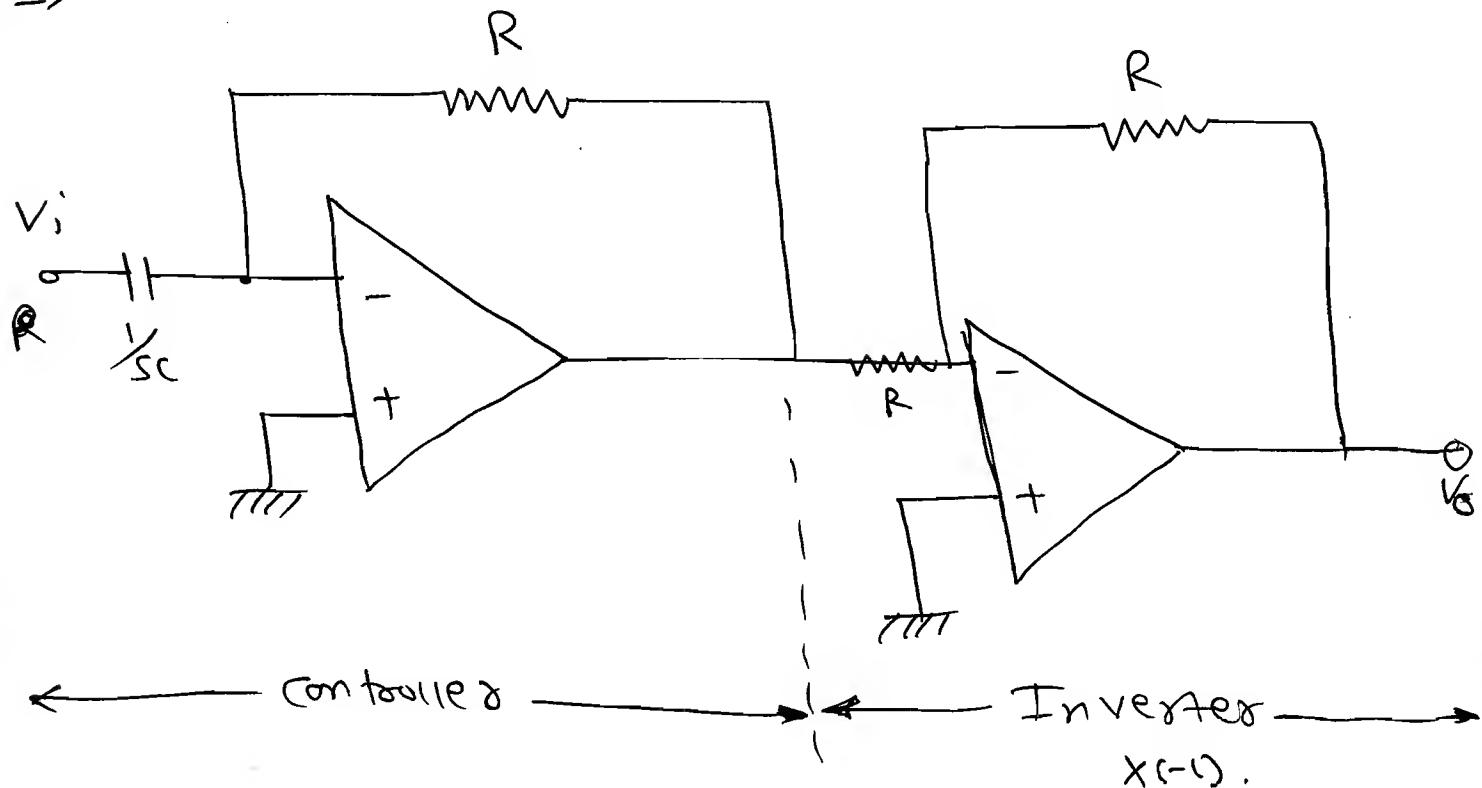

$$\rightarrow G(s) \Big|_{\text{with controller}} = \frac{K_D s}{s^2(s+10)} = \frac{K_D}{s(s+10)}$$

Type-1 ↓ ess ↑
less accurate

$$CE \rightarrow s^2 + 10s + k_0 = 0 \rightarrow \text{Stable.}$$

* PRACTICAL CKT box Derivative Controller :-

\Rightarrow

$$\Rightarrow \frac{V_o(s)}{V_i(s)} = \frac{R}{sC} = sCR = T_d s = k_0 s.$$

$$\text{Where, } k_0 = T_d = RC.$$

④ P I Controller :-

* Purpose :-

\Rightarrow To decrease the Steady-State Errors without affecting the stability.

\Rightarrow The ~~fixed~~ ~~constant~~ T.F. of the PI controller is

$$T.F. = K_p + \frac{K_I}{s}$$

$$\Rightarrow T.F. = \left(\frac{SK_p + K_I}{S} \right).$$

\Rightarrow The P-I Controller added one pole at origin which increases the Type at the system.

\Rightarrow As type \uparrow , the $e_{ss} \downarrow$.

\Rightarrow PI Controller added one finite zero in the left of the S-plane which avoid the effect on sys. stability.

Eg let, $G(s) \Big|_{\text{without controller}} = \frac{1}{s(s+10)}$ Type - 1

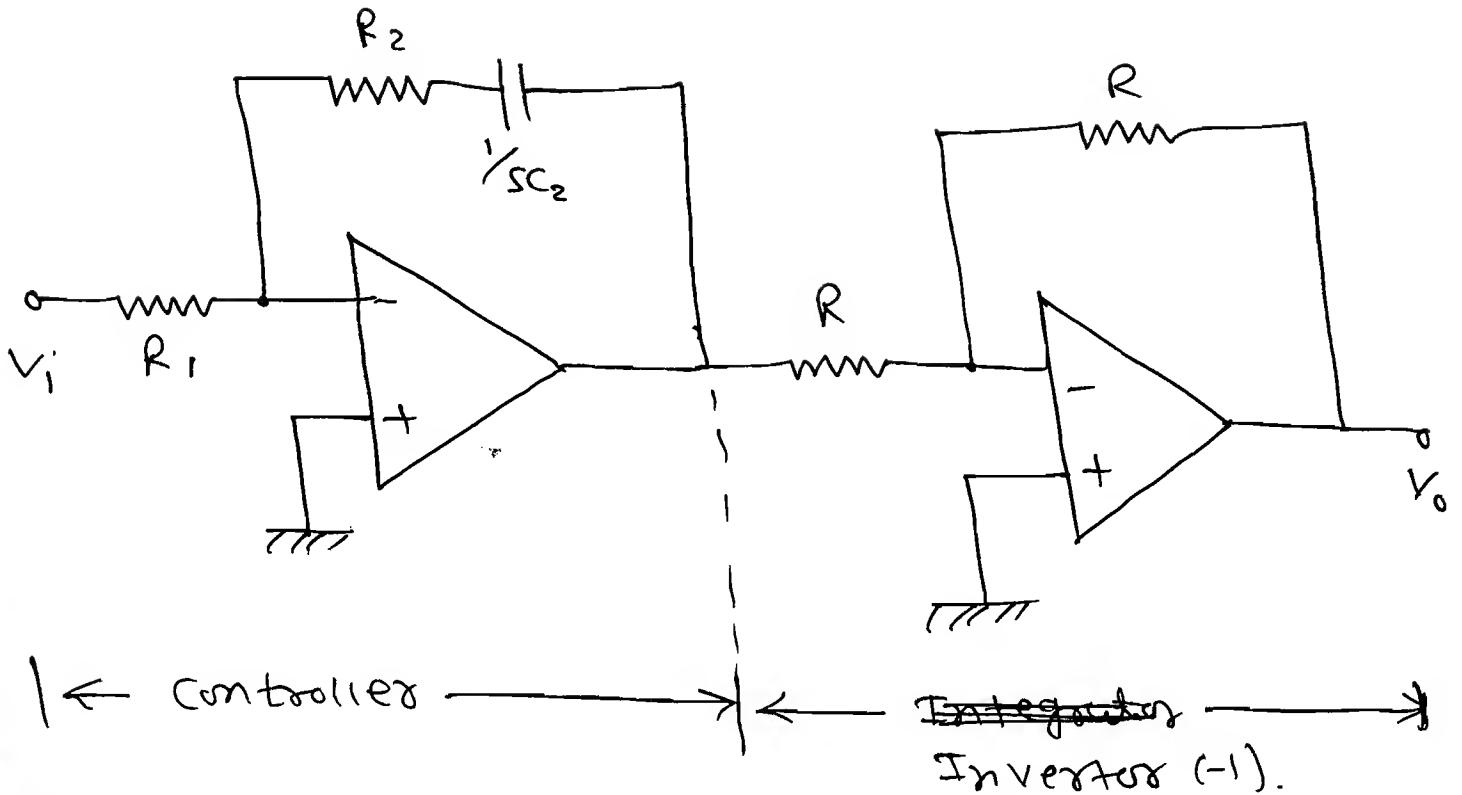

CE $s^2 + 10s + 1 = 0 \rightarrow$ Stable

$\rightarrow G(s) \Big|_{\text{with controller}} = \frac{(SK_p + K_I)}{s^2(s+10)}$, Type - 2. \uparrow , $e_{ss} \downarrow$
more accurate

CE $s^3 + 10s^2 + SK_p + K_I = 0 \rightarrow$ Stable
Stability is not affected.

* Practical Ckt for P-I Controller:-

\Rightarrow The Practical Ckt is shown in fig.

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{R_2 + \frac{1}{sC_2}}{R_1 + \cancel{R_2 + \frac{1}{sC_2}}}.$$

$$\therefore \frac{V_o(s)}{V_i(s)} = \frac{R_2}{R_1} + \frac{1}{sC_2 R_1}.$$

$$T.F. = K_p + \frac{K_I}{s}.$$

$$\text{Where, } K_p = \frac{R_2}{R}, \quad K_I = \frac{1}{R_1 C_2}.$$

(5) P D Controller :-

* Purpose :-

⇒ To improve the stability without affecting the steady state error (ess).

\Rightarrow The T.F. of PD Controller is $(K_p + K_o s)$.

\Rightarrow The P.D. controller added one finite zero in the left hand side, which improves the sus. Stability.

\Rightarrow PD Controllers do not change the type, hence no effect on steady state error.

\Rightarrow The damping factor with PD controller is $\xi_{PD} = \left[s + \frac{\omega_n K_o}{2} \right]$.

$$\Rightarrow G_{(ss)} \Big|_{\text{without Controller}} = \frac{1}{s^2(s+10)}; \quad \text{Type-2}$$

$$\xrightarrow{\text{CE}} s^3 + 10s^2 + 1 = 0 \rightarrow \text{Unstable.}$$

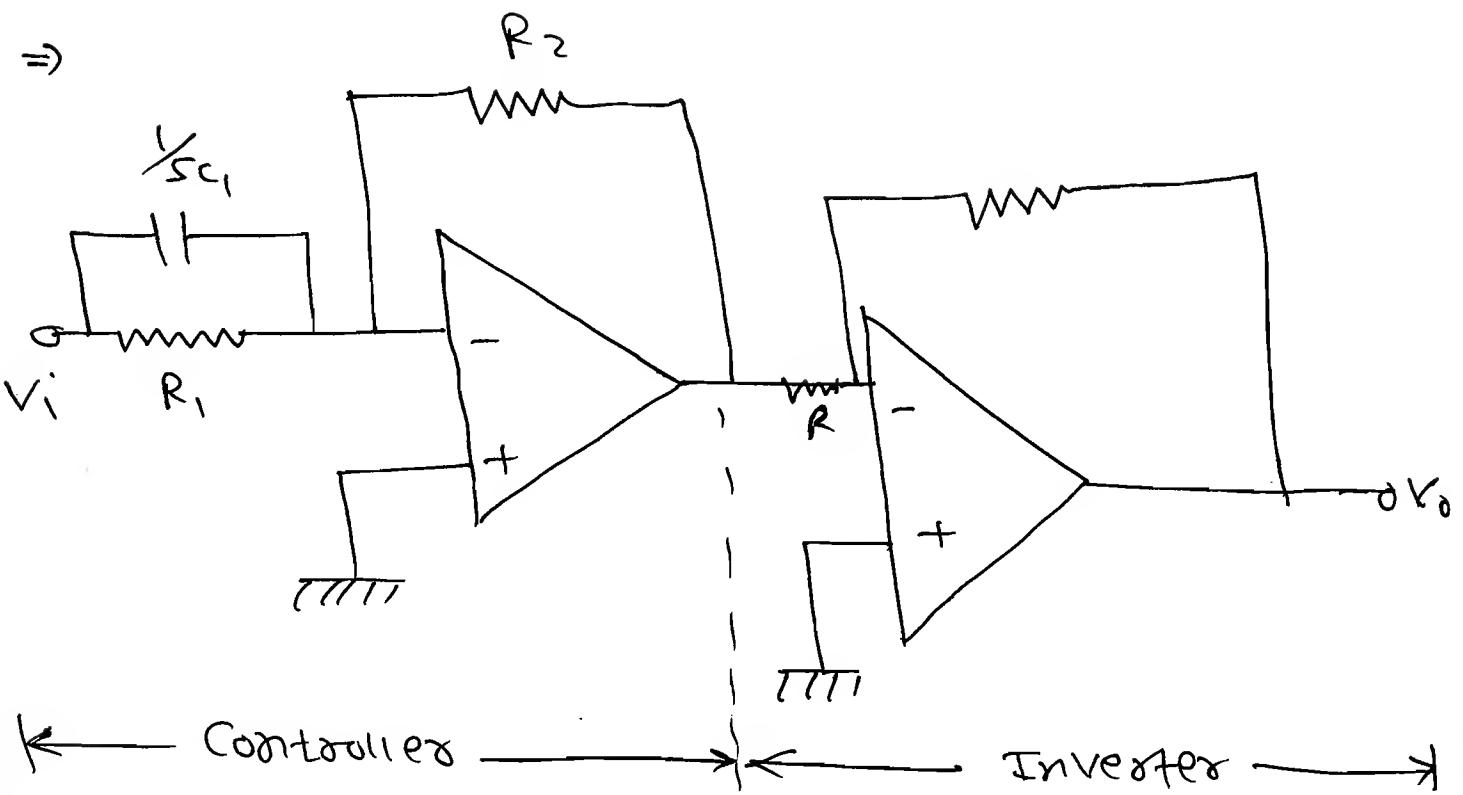

$$\Rightarrow G_{(ss)} \Big|_{\text{with Controller}} = \frac{(K_p + K_o s)}{s^2(s+10)}; \quad \begin{cases} \text{Type-2.} \\ \text{improved} \end{cases}$$

$$\xrightarrow{\text{CE}} s^3 + 10s^2 + K_o s + K_p = 0 \rightarrow \text{Stable.}$$

\Rightarrow No Change in Type, hence No Change in ESS.

\Rightarrow Stability improved.

* Practical Ckt for PD Controller :-

$$\Rightarrow T.F. = \frac{V_0(s)}{V_i(s)} = \frac{R_2}{R_1 + 1/\text{sc}_1} = \frac{R_2}{\frac{R_1}{1 + \text{sc}_1 R_1}}.$$

$$= \frac{R_2 (1 + \text{sc}_1 R_1)}{R_1}.$$

$$= \frac{R_2}{R_1} + \text{sc}_1 R_2.$$

$$= K_p + K_D s$$

Where, $K_p = \frac{R_2}{R_1}$, $K_D = C_1 R_2$.

6 PID Controller :-

* Purpose:-

\Rightarrow To decrease the steady state error & improve the stability.

⇒ The T.F. of the PID Controller:

$$T.F. = \left(K_p + \frac{K_I}{s} + K_D s \right).$$

$$T.F. = \left(\frac{K_D s^2 + K_p s + K_I}{s} \right).$$

⇒ The PID Controller added one pole at origin. Hence, the Type is ↑
Steady state error ↓.

⇒ The PID Controller added two finite zeros in left-hand side.

∴ one zero avoid the effect on system stability and other zero improves the system stability.

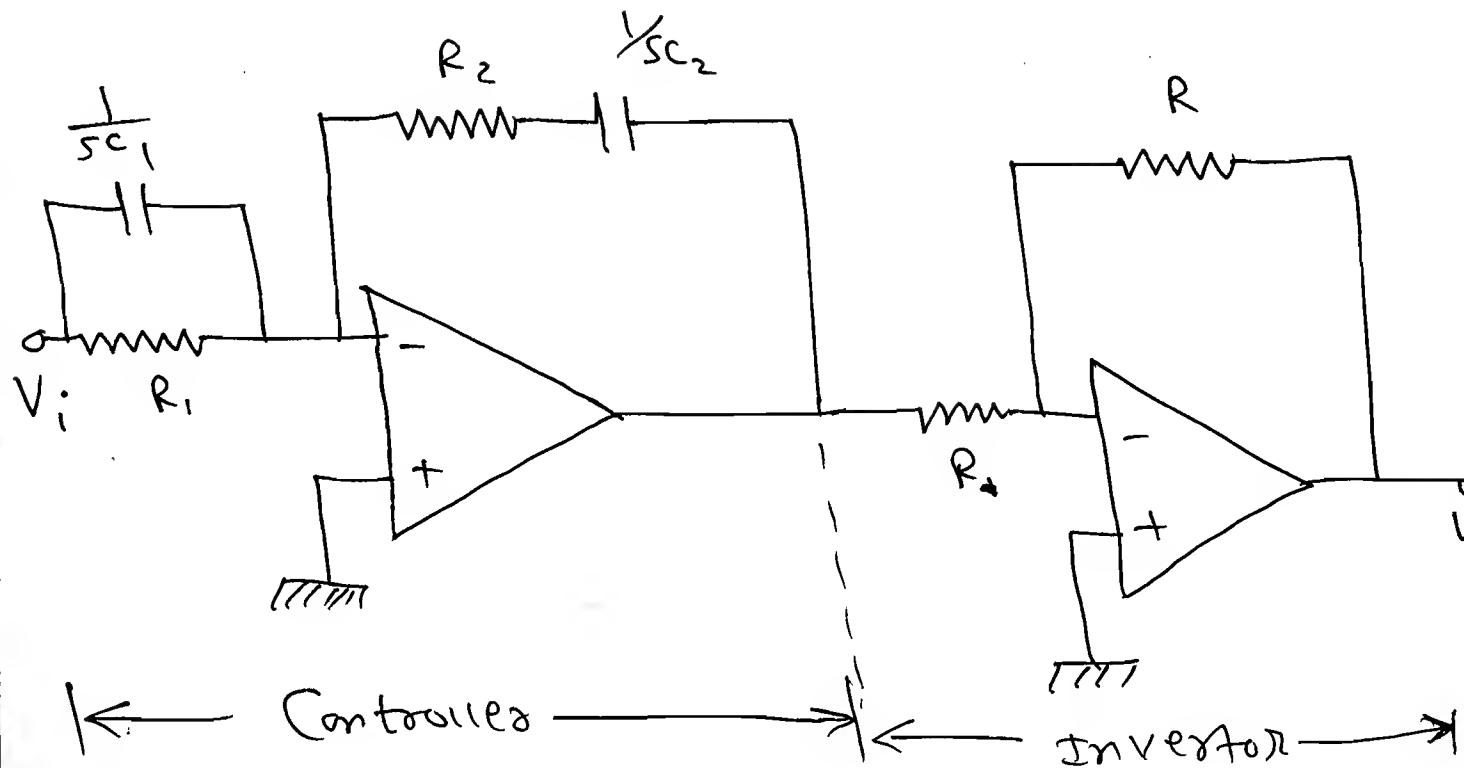

Eg: $G(s)$ without controller = $\frac{1}{s^2(s+10)}$; Type-2.

CE $\rightarrow s^3 + 10s^2 + 1 = 0 \rightarrow$ Unstable.

→ $G(s)$ with controller = $\frac{K_D s^2 + K_p s + K_I}{s^3(s+10)}$; Type-3.
Improved ESS ↓

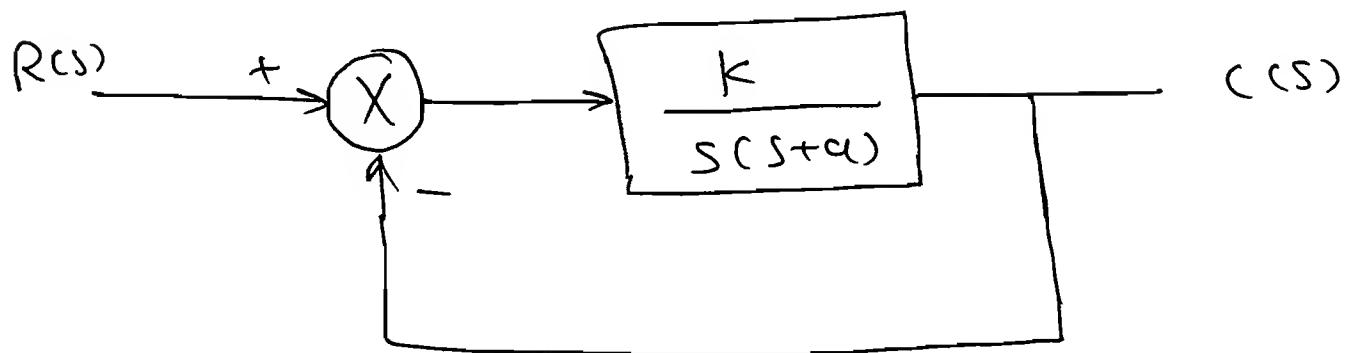

CE $\rightarrow s^4 + 10s^3 + K_D s^2 + K_p s + K_I = 0 \rightarrow$ Stable
(more accurate)

* Practical Ckt for PID Controller :-

$$\begin{aligned}
 \Rightarrow T.F. &= \frac{V_o(s)}{V_i(s)} \\
 &= \frac{R_2 + \frac{1}{sC_2}}{\frac{R_1}{sC_1 R_1 + 1}} \\
 &= \frac{(1 + sC_2 R_2)(1 + sC_1 R_1)}{sC_2 R_1} \\
 &= \frac{1 + s(C_2 R_2 + C_1 R_1) + s^2 C_2 R_2 C_1 R_1}{sC_2 R_1} \\
 &= \underbrace{\left(\frac{R_2}{R} + \frac{C_1}{C_2} \right)}_{T.P.} + \underbrace{\left(\frac{1}{sC_2 R_1} \right)}_{K_I} + \underbrace{(sC_1 R_2)}_{K_D \cdot s}
 \end{aligned}$$

Q Find the Steady State error of sensitivity to change in parameters.
 (i) K (ii) a to the unit-jump IIP to the following system.

$$\text{Soln: } G(s) = \frac{K}{s(s+a)}.$$

$R(s)$ = unit jump

$x(t) = t^{\frac{1}{2}} u(t)$. & Type-1

$$\therefore e_{ss} = \frac{1}{K/a} = a/K.$$

$$(i) S_K^{ess} = \left(\frac{\partial e_{ss}}{\partial K} \right) \times \left(\frac{1}{e_{ss}} \right) = -\frac{1}{K^2} \times \frac{K}{a/K}$$

$$\therefore S_K^{ess} = -1$$

$$(ii) S_a^{ess} = \left(\frac{\partial e_{ss}}{\partial a} \right) \times \left(\frac{a}{e_{ss}} \right) = \frac{1}{K} \times \frac{a}{a/K}$$

$$\therefore S_K^{ess} = 1$$
